

JBI User's Guide

Apache ServiceMix Version 4.4.2

1. Introduction to JBI

1.1. What is JBI?

TODO: Describe what the JBI specification is all about

1.2. Message Exchange Patterns

TODO: Describe the four standard JBI MEPs

1.3. JBI API

TODO: Describe the standard JBI API (MessageExchange, NormalizedMessage, ...)

2. JBI Components

2.1. servicemix-bean

Overview

The ServiceMix Bean component provides integration with beans (POJOs) with the JBI bus to make it easy to use POJOs to process JBI message exchanges. Like in an Message Driven Bean in J2EE a POJO will receive a message from the NMR and process it in any way it likes. Unlike in a JMS component where the coding is already done the Bean component gives the developer the freedom to create any type of message handling but it must be hand coded all the way.

Namespace and xbean.xml

The namespace URI for the servicemix-bean JBI component is http://servicemix.apache.org/bean/1.0. This is an example of an xbean.xml file with a namespace definition with prefix bean.

Endpoint types

The servicemix-bean component only defines one endpoint, called bean:endpoint. It can be used to receive and send message exchanges from/to the NMR.

Endpoint bean: endpoint

There are two ways to configure the bean endpoint. The first is using the fully qualified name of the class and the second is by passing to the endpoint a reference to an existing bean.

Using a Java class

When definining a bean: endpoint specifying a Java class name, a new instance of this class will be created for handling a single message exchange.

Using a spring bean

Alternative, a reference to an existing bean can be passed to the bean endpoint.

Attention: The Bean Endpoint schema allows to set a Bean or a Bean Name. The Bean will create a **single** instance of the POJO per endpoint whereas the Bean Name will create an instance per request (message exchange).

Property Name	Туре	Description
applicationContext	org.springframework.context.ApplicationContext	Set the Spring ApplicationContext where the bean can be found. Defaults to the context defined in xbean.xml
bean	java.lang.Object	Set the bean to be used for handling exchanges
beanClassName	java.lang.String	Set the bean class name to be used for handling exchanges. A new instance will be created on the fly for every exchange.
beanInfo	org.apache.servicemix.bean.support.BeanInfo	Set a custom bean info object to define the bean to be used for handling exchanges
beanName	java.lang.String	Set the name of the bean in the application context to be used for handling exchanges
beanType	java.lang.Class	Set the bean class to be used for handling exchanges. A new instance will be created on the fly for every exchange.
component	org.apache.servicemix.bean.BeanComponent	
correlationExpression	org.apache.servicemix.expression.Expression	Set a custom expression to use for correlating exchanges into a single request handled by the same bean instance. The default expression uses a correlation

		ID set on the exchange properties.
endpoint	java.lang.String	The name of the endpoint.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
methodInvocationStrategy	org.apache.servicemix.bean.support.MethodInvocationStrategy	Set a custom invocation strategy to define how the bean is being invoked. The default implementation takes some additional parameter annotations into account.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
serviceEndpoint	javax.jbi.servicedesc.ServiceEndpoint	

MessageExchangeListener

The first kind of POJOs you can deploy implement the MessageExchagneListener interface. In such a case, servicemix-bean acts as a replacement of the lightweight container component. This level offers the most control on the exchange received and sent. This is usually used with the injected <code>DeliveryChannel</code> to send back the exchanges, or if the POJOs needs to act as a consumer (i.e. creating and sending exchanges to other services).

These POJOs are low-level POJOs: you need to understand the JBI Api and Message Exchange Patterns to correctly handle incoming exchanges.

Note that at this point (v 3.1), there is no base class that you can inherit to speed you in this process of implementing a POJO to handle JBI exchanges, but hopefully it will come in the future.

Examples

This example on the right shows the most simple bean. When it receives an exchange, it will print it to the console and set the status to DONE before sending the exchange back. This bean can not handle InOut exchanges, as it does not set any response (an exception would be thrown in such a case).

```
import org.apache.servicemix.jbi.listener.MessageExchangeListener;
import javax.annotation.Resource;
import javax.jbi.messaging.DeliveryChannel;
import javax.jbi.messaging.ExchangeStatus;
import javax.jbi.messaging.MessageExchange;
import javax.jbi.messaging.MessagingException;

public class ListenerBean implements MessageExchangeListener {

    @Resource
    private DeliveryChannel channel;

    public void onMessageExchange(MessageExchange exchange) throws MessagingException {
        System.out.println("Received exchange: " + exchange);
        exchange.setStatus(ExchangeStatus.DONE);
        channel.send(exchange);
    }
}
```

This example will handle an InOut exchange and will send back the input as the response. Note that this example would fail if receiving an InOnly exchange, as setting a response on an InOnly exchange is not a legal operation.

This is similar example as the one from above (also works only for InOut exchange) but it shows how you can extract message from an exchange in order to process it and send back.

```
import org.apache.servicemix.jbi.listener.MessageExchangeListener;
import org.apache.servicemix.jbi.util.MessageUtil;
import org.apache.servicemix.jbi.jaxp.SourceTransformer;
import javax.annotation.Resource;
import javax.jbi.messaging.DeliveryChannel;
import javax.jbi.messaging.ExchangeStatus;
import javax.jbi.messaging.MessageExchange;
import javax.jbi.messaging.MessagingException;
import javax.jbi.messaging.NormalizedMessage;
import javax.xml.transform.Source;
public class ListenerBean implements MessageExchangeListener {
   private DeliveryChannel channel;
   public void onMessageExchange(MessageExchange exchange) throws MessagingException {
        if (exchange.getStatus() == ExchangeStatus.ACTIVE) {
                        NormalizedMessage message = exchange.getMessage("in");
                        Source content = message.getContent();
                        //process content according to your logic
                        //e.g. to access the message body as a String use
                        String body = (new SourceTransformer()).toString(content);
                        message.setContent(content);
                        exchange.setMessage(message, "out");
                        channel.send(exchange);
       }
   }
}
```

Disclaimer

In versions 3.1 to 3.1.2 the ServiceMix Bean component will not handle asynchronous messages correctly because the final send of the message marked as DONE back to the NMR will be handled as a consumer message and that fails because there is no corresponding provider message. The only workaround is to send the messages synchronously.

Note: This was resolved in 3.1.3, 3.2.x and later via <u>SM-1110</u>.

MessageExchange dispatching

If the POJO deployed implements the org.apache.servicemix.MessageExchangeListener, every message received for this POJO will be dispatched to the onMessageExchange method.

In other cases, exchanges in a provider role will be dispatched according to the MethodInvocationStrategy configured on the endpoint. The default one try to find the method according to the operation name defined on the exchange. If there is only a single method acting as an operation, it will always be used.

Annotations

The servicemix-bean component can accept different kind of POJOs. These POJOs may be annotated to customize their behavior. All the following annotations belong to the org.apache.servicemix.bean package.

Annotation Target	Description
-------------------	-------------

Callback	Method	
Content	Parameter	
Correlation	Type	
Endpoint	Type	This annotation is mandatory if the bean is automatically searched from a list of packages.
ExchangeTarget	Field	
<u>Operation</u>	Method	
<u>Property</u>	Parameter	
<u>XPath</u>	Parameter	

In addition, standard annotations can be used:

Annotation	Target	Description	
<u>Resource</u>	Field	The Resource annotation marks a resource that is needed by the application. Currently, this annotation is only supported on fields of type <code>ComponentContext</code> and <code>DeliveryChannel</code> . The component will inject the specified resource when the POJO is instantiated.	
PostConstruct	Method	The PostConstruct annotation is used on a method that needs to be executed after dependency injection is done to perform any initialization.	
PreDestroy	Method	The PreDestroy annotation is used on methods as a callback notification to signal that the instance is in the process of being removed by the container.	

The following interfaces are part of this API:

Interface	Description	
MessageExchangeListener	When the POJO implements this interface, all exchanges will be dispatched to the onMessageExchange method .	
Destination	This interface can be used to define a property on the bean, annotated with the <code>@ExchangeTarget</code> annotation. This is a very simple API to send exchanges from a POJO. More complex use cases can use an injected <code>DeliveryChannel</code> directly or to create a ServiceMix client.	

More Examples

- AnnotatedBean
- AutoDeployedBean
- ConsumerBean
- ListenerBean
- PlainBean

2.2. servicemix-camel

Overview

The servicemix-camel component provides support for using Apache Camel to provide a full set of Enterprise Integration Patterns and flexible routing and transformation in both Java code or Spring XML to route services on the Normalized Message Router.

Namespace and camel-context.xml

When creating a servicemix-camel service unit, we reuse the default Camel namespace http://camel.apache.org/schema/spring.

This is an example camel-context.xml which uses the Spring DSL to define the Camel routes

It is also possible to use the Java DSL inside a servicemix-camel service unit by referring to the package that contains the RouteBuilder classes. An example: this camel-context.xml file will activate all routes defined by RouteBuilders in the org.apache.servicemix.example.camel package.

```
<?xml version="1.0" encoding="UTF-8"?>
<beans xmlns="http://www.springframework.org/schema/beans"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="
        http://www.springframework.org/schema/beans
        http://www.springframework.org/schema/beans/spring-beans-2.0.xsd
        http://camel.apache.org/schema/spring
        http://camel.apache.org/schema/spring/camel-spring.xsd">

<camelContext xmlns="http://camel.apache.org/schema/spring">
        <packages>org.apache.servicemix.examples.camel</packages>
        </camelContext>

</beans>
```

URI

Camel routes use URIs to interact with the ESB. You can use these URIs to expose new endpoints on the ESB as well as to send message exchanges to existing endpoints.

The snippet below automatically exposes a new endpoint to the bus, where the service QName is MyService and the endpoint name is MyEndpoint.

```
from("jbi:endpoint:http://foo.bar.org/MyService/MyEndpoint")
```

When a JBI endpoint appears at the end of a route, as in the example below, that will send

```
to("jbi:endpoint:http://foo.bar.org/MyService/MyEndpoint")
```

The messages sent by this producer endpoint are sent to the already deployed JBI endpoint.

URI format

```
jbi:service:serviceNamespace[sep]serviceName[?options]
jbi:endpoint:serviceNamespace[sep]serviceName[sep]endpointName[?options]
jbi:name:endpointName[?options]
```

The separator that should be used in the endpoint URL is:

- / (forward slash), if serviceNamespace starts with http://
- : (colon), if serviceNamespace starts with urn:.

You can append query options to the URI in the following format, ?option=value&ption=value&...

Examples

Using jbi:service

```
jbi:service:http://foo.bar.org/MyService
jbi:service:urn:foo:bar:MyService
```

Using jbi:endpoint

```
jbi:endpoint:urn:foo:bar:MyService:MyEndpoint
jbi:endpoint:http://foo.bar.org/MyService/MyEndpoint
```

Using jbi:name

When using jbi:name, the component uses http://activemq.apache.org/camel/schema/jbi}endpoint as the default Service QName.

```
jbi:name:MyEndpoint
```

URI options

Name	Default value	Description
mep	MEP of the Camel Exchange	Allows users to override the MEP set on the Exchange object. Valid values for this option are in-only, in-out, robust-in-out and in-optional-out.
operation	Value of the jbi.operation header property	Specifies the JBI operation for the MessageExchange. If no value is supplied, the JBI binding will use the value of the jbi.operation header property.
serialization	basic	Default value (basic) will check if headers are serializable by looking at the type, setting this option to strict will detect objects that can not be serialized although they implement the Serializable interface. Set to nocheck to disable this check altogether, note that this should only be used for in-memory transports like SEDAFlow, otherwise you can expect to get NotSerializableException thrown at runtime.
convertException	false	false: send any exceptions thrown from the Camel route back unmodified

true: convert all exceptions to a JBI FaultException (can be used to avoid
non-serializable exceptions or to implement generic error handling

Examples

```
jbi:service:http://foo.bar.org/MyService?mep=in-out (override the MEP, use InOut JBI MessageEx jbi:endpoint:urn:foo:bar:MyService:MyEndpoint?mep=in (override the MEP, use InOnly JBI MessageE jbi:endpoint:urn:foo:bar:MyService:MyEndpoint?operation={http://www.mycompany.org}AddNumbers (overide the operation for the JBI Exchange to {http://www.mycompany.org}AddNumbers)
```

Example routes

Simple Spring route

This simple Spring route registers a new endpoint on the ESB (service Router, endpoint name orders). The message exchange contents will be logged and then forwarded to another JBI service endpoint (service OrderService)

The same route using the Java DSL

When we implement the same route in the Java DSL, we first code our RouteBuilder implementation

In our camel-context.xml file, we just refer to the org.apache.servicemix.example package that contains our JbiRouteBuilder.

```
<beans xmlns="http://www.springframework.org/schema/beans"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="
    http://www.springframework.org/schema/beans
    http://www.springframework.org/schema/beans/spring-beans-2.0.xsd
    http://camel.apache.org/schema/spring
    http://camel.apache.org/schema/spring/camel-spring.xsd">

    <camelContext xmlns="http://camel.apache.org/schema/spring">
        <camelContext xmlns="http://camel.apache.org/schema/spring">
        <packageScan>
        <packageScan>
        <packageScan>
        </packageScan>
        </packageScan>
```

Special considerations

Stream handling

If you are using a stream type as the message body, you should be aware that a stream is only capable of being read once. So if you enable <code>DEBUG</code> logging, the body is usually logged and thus read. To deal with this, Camel has a <code>streamCaching</code> option that can cache the stream, enabling you to read it multiple times.

```
from("jbi:endpoint:http://foo.bar.org/MyService/MyEndpoint")
    .streamCaching()
    .to("xslt:transform.xsl", "bean:doSomething");
```

Camel will cache large input streams (by default, over 64K) in a temp file using CachedOutputStream. When you close the input stream, the temp file will be deleted.

2.3. servicemix-cxf-bc

Overview

A JBI compliant HTTP/SOAP or JMS/SOAP binding component named servicemix-cxf-bc which use apache cxf internally.

The main features are:

- JBI compliant Binding Component
- Usable in a lightweight mode in servicemix.xml configuration files
- SOAP 1.1 and 1.2 support
- · MIME attachments
- Support for all MEPs as consumers or providers
- SSL support
- WS-Security support

- WS-Policy support
- WS-RM support
- WS-Addressing support

Namespace and xbean.xml

The namespace URI for the servicemix-bean JBI component is http://servicemix.apache.org/cxfbc/1.0. This is an example of an xbean.xml file with a namespace definition with prefix bean.

```
<beans xmlns:cxfbc="http://servicemix.apache.org/cxfbc/1.0">
  <!-- add cxfbc:consumer or cxfbc:provider definitions here -->
  </beans>
```

Endpoint types

The servicemix-cxf-bc component defines two endpoints:

- cxfbc:consumer :: a server-side cxf endpoint that will consume plain HTTP+SOAP requests and send them into the NMR to a given JBI endpoint
- cxfbc:provider:: a client-side jbi endpoint which can receive requests from the NMR and send them to a given url where the service is provided

cxfbc:consumer

Property Name	Туре	Description
busCfg	java.lang.String	the location of the CXF configuration file used to configure the CXF bus. This allows you to configure features like WS-RM and JMS runtime behavior.
delegateToJaas	boolean	Specifies if the endpoint delegate to JAASAuthenticationService to do the authentication.
endpoint	java.lang.String	The name of the endpoint.
features	(java.lang.Object)*	Specifies the cxf features set for this endpoint
inFaultInterceptors	(java.lang.Object)*	a list of beans configuring interceptors that process incoming faults
inInterceptors	(java.lang.Object)*	a list of beans configuring interceptors that process incoming responses
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
locationURI	java.lang.String	the HTTP address to which requests are sent. This value will overide any value specified in the WSDL.
mtomEnabled	boolean	Specifies if MTOM / attachment support is enabled. Default is <code>false</code> .

outFaultInterceptors	(java.lang.Object)*	a list of beans configuring interceptors that process fault messages being returned to the consumer
outInterceptors	(java.lang.Object)*	a list of beans configuring interceptors that process requests
properties	java.util.Map	Sets arbitrary properties that are added to the CXF context at the Endpoint level
providedBus	org.apache.cxf.Bus	a preconfigured CXF Bus object to use; overrides busCfg
schemaValidationEnabled	boolean	Specifies if the endpoint use schemavalidation for the incoming/outgoing message.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
synchronous	boolean	Specifies if the endpoint expects send messageExchange by sendSync .
targetEndpoint	java.lang.String	the name of the endpoint to which requests are sent
targetInterface	javax.xml.namespace.QName	the QName of the interface to which requests are sent
targetOperation	javax.xml.namespace.QName	the QName of the operation to which requests are sent
targetService	javax.xml.namespace.QName	the QName of the service to which requests are sent
targetUri	java.lang.String	Set the target service/endpoint/interface using a URI.
timeout	long	the number of second the endpoint will wait for a response. The default is unlimited.
useJBIWrapper	boolean	Specifies if the JBI wrapper is sent in the body of the message. Default is <code>true</code> .
useSOAPEnvelope	boolean	Specifies if the endpoint expects soap messages when useJBIWrapper is false,
wsdl	org.springframework.core.io.Resource	the location of the WSDL document defining the endpoint's interface
x509	boolean	Specifies if the endpoint use X.509 Certificate to do the authentication.

cxfbc:provider

Property Name	Туре	Description
busCfg	java.lang.String	the location of the CXF configuration file used to configure the CXF bus. This allows you to configure features like WS-RM and JMS runtime behavior.
endpoint	java.lang.String	The name of the endpoint.
features	(java.lang.Object)*	Specifies the cxf features set for this endpoint
inFaultInterceptors	(java.lang.Object)*	a list of beans configuring interceptors that process incoming faults
inInterceptors	(java.lang.Object)*	a list of beans configuring interceptors that process incoming requests

interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
locationURI	java.net.URI	the HTTP address of the exposed service. This value will overide any value specified in the WSDL.
mtomEnabled	boolean	Specifies if MTOM / attachment support is enabled. Default is <code>false</code> .
outFaultInterceptors	(java.lang.Object)*	a list of beans configuring interceptors that process fault messages being returned to the consumer
outInterceptors	(java.lang.Object)*	a list of beans configuring interceptors that process responses
properties	java.util.Map	Sets arbitrary properties that are added to the CXF context at the Endpoint level
providedBus	org.apache.cxf.Bus	a preconfigured CXF Bus object to use; overrides busCfg
schemaValidationEnabled	boolean	Specifies if the endpoint use schemavalidation for the incoming/outgoing message.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
synchronous	boolean	Specifies if the endpoints send message synchronously to external server using underlying
useJBIWrapper	boolean	Specifies if the JBI wrapper is sent in the body of the message. Default is <code>true</code> .
useSOAPEnvelope	boolean	Specifies if the endpoint expects soap messages when useJBIWrapper is false,
wsdl	org.springframework.core.io.Resource	the location of the WSDL document defining the endpoint's interface

Examples

Configuring the CXF JMS Transport

The ServiceMix CXF binding component also allows using the CXF JMS Transport to send and receive messages. You can use the <cxf:features/> element to add and configure the org.apache.cxf.transport.jms.JMSConfigFeature on the endpoint, as in the example below.

```
<cxfbc:provider wsdl="org/apache/servicemix/cxfbc/ws/security/hello world.wsdl"</pre>
              service="greeter:HelloWorldService"
              endpoint="HelloWorldPortProxy"
              interfaceName="greeter:Greeter"
              busCfg="jms conduit config.xml">
  <!-- add interceptors here -->
  <cxfbc:features>
     <bean class="org.apache.cxf.transport.jms.JMSConfigFeature">
        property name="jmsConfig">
            <bean class="org.apache.cxf.transport.jms.JMSConfiguration">
                roperty name="concurrentConsumers">
                    <value>5</value>
                </property>
                roperty name="connectionFactory">
                    <ref bean="myConnectionFactory" />
                </property>
                property name="targetDestination">
                    <value>test.jmstransport.text.provider</value>
                </property>
                property name="useJms11">
                    <value>false</value>
                </property>
            </bean>
        </property>
     </bean>
  </cxfbc:features>
</cxfbc:provider>
<amq:connectionFactory id="myConnectionFactory" brokerURL="vm://localhost"/>
```

The jms_conduit_config.xml file specified in the busCfg parameter, is optional and can be used to specify additional JMS transport parameters:

Configuring the CXF HTTP Transport

In order to configure the underlying HTTP transport used by a CXF BC endpoint, you can specify an additional busCfg file as in the example below.

The http_conduit_config.xml file can then specify the additional CXF configuration. Have a look at this page for an overview of all the options supported by CXF.

2.4. servicemix-cxf-se

Overview

ServiceMix CXF SE component is a JBI Service Engine exposing (annotated) POJO as services on the IBI Rus.

It uses Apache CXF internally to perform service invocations and xml marshaling.

Features:

- jsr181 annotations
- jaxb2/aegis/xmlbeans databinding
- wsdl auto generation
- java proxy support
- MTOM / attachments support

Namespace and xbean.xml

The namespace URI for the servicemix-bean JBI component is http://servicemix.apache.org/cxfse/1.0. This is an example of an xbean.xml file with a namespace definition with prefix bean.

```
<beans xmlns:cxfse="http://servicemix.apache.org/cxfse/1.0">
  <!-- add cxfse:endpoint definitions here -->
  </beans>
```

Endpoint types

The servicemix-cxf-bc component defines one endpoint type:

cxfse:endpoint :: no description yet

cxfse:endpoint

Endpoint properties

Property Name	Type	Description
endpoint	java.lang.String	The name of the endpoint.
inFaultInterceptors	(java.lang.Object)*	a list of beans configuring interceptors that process incoming faults
inInterceptors	(java.lang.Object)*	a list of beans configuring interceptors that process incoming requests
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
mtomEnabled	boolean	Specifies if the service can consume MTOM formatted binary data. The default is <code>false</code> .
outFaultInterceptors	(java.lang.Object)*	a list of beans configuring interceptors that process fault messages being returned to the consumer
outInterceptors	(java.lang.Object)*	a list of beans configuring interceptors that process response messages
pojo	java.lang.Object	a bean configuring the JAX-WS annotated implementation for the endpoint
pojoEndpoint	javax.xml.namespace.QName	Specifies the servicemodel endpoint name generated from the pojo. The default is <code>null</code> .
pojoInterfaceName	javax.xml.namespace.QName	Specifies the servicemodel interface name generated from the pojo. The default is <code>null</code> .
pojoService	javax.xml.namespace.QName	Specifies the servicemodel service name generated from the pojo. The default is <code>null</code> .
properties	java.util.Map	Specifies a map of properties
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
useAegis	boolean	Specifies if the endpoint use aegis databinding to marshall/unmarshall message. The default is <code>false</code> .
useJBIWrapper	boolean	Specifies if the endpoint expects to receive the JBI wrapper in the message received from the NMR. The default is <code>true</code> . Ignore the value of useSOAPEnvelope if useJBIWrapper is true
useSOAPEnvelope	boolean	Specifies if the endpoint expects soap messages when useJBIWrapper is false, if useJBIWrapper is true then ignore useSOAPEnvelope. The default is <code>true</code> .
useXmlBeans	boolean	Specifies if the endpoint use xmlbeans databinding to marshell/unmarshell message. The default is <code>false</code> .

cxfbc:proxy

Property Name Type	Description
--------------------	-------------

componentRegistry	java.lang.Object	Allows injecting a custom component registry for looking up the proxying endpoint.
container	org.apache.servicemix.jbi.api.Container	Allows injecting a JBI Container instance (e.g. for testing purposes).
context	javax.jbi.component.ComponentContext	Allows injecting the ComponentContext
endpoint	java.lang.String	The name of the endpoint.
factory	org.apache.servicemix.jbi.api.ClientFactory	Allows injecting a ClientFactory
interfaceName	javax.xml.namespace.QName	Specifies the servicemodel interface name
mtomEnabled	boolean	Specifies if the service can consume MTOM formatted binary data. The default is <code>false</code> .
name	java.lang.String	Specifies the JNDI name for looking up the ClientFactory. Defaults to <code>java:comp/env/jbi/ClientFactory</code> .
propagateSecuritySubject	boolean	When set to <code>true</code> , the security subject is propagated along to the proxied endpoint. Defaults to <code>false</code> .
service	javax.xml.namespace.QName	Specifies the servicemodel service name
type	java.lang.Class	Specifies the webservice POJO type
useJBIWrapper	boolean	Specifies if the endpoint expects to receive the JBI wrapper in the message received from the NMR. The default is <code>true</code> . Ignore the value of useSOAPEnvelope if useJBIWrapper is true
useSOAPEnvelope	boolean	Specifies if the endpoint expects soap messages when useJBIWrapper is false, if useJBIWrapper is true then ignore useSOAPEnvelope. The default is <code>true</code> .

2.5. servicemix-drools

Overview

The ServiceMix Drools component provides JBI integration to the Drools Rules Engine.

This Service Engine can be used to deploy a rules set that will implement a router or an actual service.

A router will mostly act as a transparent proxy between the consumer and the target service provider mad will mostly be implemented by the jbi.route(uri) method below. This method creates a new exchange identical to the one received by the component and will send it to the specified destination. You can also send back a Fault if needed. A router can also be implemented by using directly the JBI Apis (available with the jbi helper) by using the provided client.

Namespace and xbean.xml

The namespace URI for the servicemix-bean JBI component is http://servicemix.apache.org/drools/1.0. This is an example of an xbean.xml file with a namespace definition with prefix bean.

```
<beans xmlns:drools="http://servicemix.apache.org/drools/1.0">
  <!-- add drools:endpoint definitions here -->
  </beans>
```

Endpoint types

The servicemix-drools component defines one endpoint type:

drools:endpoint :: no description yet

drools:endpoint

Property Name	Туре	Description
assertedObjects	(java.lang.Object)*	List of additional objects to be inserted into the drools working memory for evaluating rules.
autoReply	boolean	Will this endpoint automatically reply to any exchanges not handled by the Drools rulebase?
component	org.apache.servicemix.common.DefaultComponent	
defaultTargetService	javax.xml.namespace.QName	The default service that the exchange will be sent to if none of the rules have handled it.
defaultTargetURI	java.lang.String	The default endpoint URI that the exchange will be sent to if none of the rules have handled it.
endpoint	java.lang.String	The name of the endpoint.
globals	java.util.Map	The global variables that are available while evaluating the rule base.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
namespaceContext	javax.xml.namespace.NamespaceContext	The namespace context to use when evaluating the rules.
ruleBase	org.drools.RuleBase	Set the rule base to be used for handling the exchanges
ruleBaseResource	org.springframework.core.io.Resource	Specifies the resource location to load the rule base from (.drl file)
ruleBaseURL	java.net.URL	Specifies a URL to load the rule base from (.drl file)
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
su	org.apache.servicemix.common.ServiceUnit	

2.6. servicemix-eip

Overview

The servicemix-eip component is a routing container where different routing patterns can be deployed as service unit.

This component is based on the great Enterprise Integration Patterns book.

Namespace and xbean.xml

The namespace URI for the servicemix-bean JBI component is http://servicemix.apache.org/eip/1.0. This is an example of an xbean.xml file with a namespace definition with prefix eip.

Endpoint types

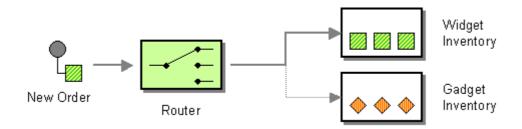

The servicemix-eip component defines several endpoint types:

- eip:content-based-router:: Implements the Content-Based Router EIP
- eip:message-filter::Implements the Message Filter EIP
- eip:pipeline :: Implements the Pipeline EIP
- eip:static-recipient-list::Implements the Static Recipient List EIP
- eip:static-routing-slip :: Implements the Static Routing Slip EIP
- eip:wire-tap::Implements the Wire Tap EIP
- eip:xpath-splitter :: Uses XPath to split a message
- eip:split-aggregator :: Aggregates messages that have been split by the xpath-splitter
- eip:content-enricher :: Implements the Content Enricher EIP
- eip:resequencer :: Implements the Resequencer EIP
- eip:async-bridge :: Handles an InOut exchange by correlating to separate InOnly exchanges

In addition, this component can use all ServiceMix flows (including clustered and transactional flows), can be configured to be resilient to crashes and supports full fail-over to another node when clustered.

Content Based Router

ContentBasedRouter can be used for all kind of content-based routing. This pattern implements the <u>Content-Based Router</u> pattern.

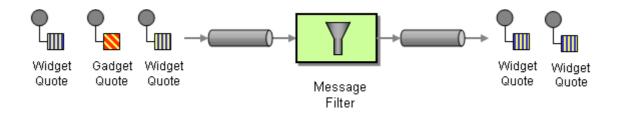

Property Name	Туре	Description
endpoint	java.lang.String	The name of the endpoint.
forwardOperation	boolean	Forward the operation qname when sending the exchange to the target.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
lockManager	org.apache.servicemix.common.locks.LockManager	The lock manager to use for this endpoint. If none is explicitely specified a default implementation will be provided.
rules	(<pre>org.apache.servicemix.eip.support.RoutingRule</pre>	The list of routing rules.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
store	org.apache.servicemix.store.Store	Configure the store to use. If none is explicitely configured, the storeFactory will be used to create one.
storeFactory	org.apache.servicemix.store.StoreFactory	The store factory to use when creating a store. If no factory is explicitely defined, an in-memory only factory will be created.
timerManager	org.apache.servicemix.timers.TimerManager	The timer manager to use for this endpoint. If none is explicitely configured, a default implementation will be provided.
wsdlExchangeTarget	org.apache.servicemix.eip.support.ExchangeTarget	An exchange target pointing to a JBI endpoint that will be used to load the WSDL describing this endpoint. This can be used when the endpoint proxies another endpoint so that the same WSDL definition will be exposed."
wsdlResource	org.springframework.core.io.Resource	When specified, this spring resource will be used to load the WSDL that

will be exposed as a description for this endpoint. This property can be used to explicitely define the WSDL to be exposed by this endpoint. This property takes precedence over the
wsdlExchangeTarget property.

Message Filter

MessageFilter allows filtering incoming JBI exchanges. As it drops unwanted messages and in an InOut exchange a response is required, MessageFilter and InOut MEPs cannot be used together. This pattern implements the <u>Message Filter</u> pattern.

Property Name	Туре	Description
endpoint	java.lang.String	The name of the endpoint.
filter	org.apache.servicemix.eip.support.Predicate	The filter to use on incoming messages
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
lockManager	org.apache.servicemix.common.locks.LockManager	The lock manager to use for this endpoint. If none is explicitely specified a default implementation will be provided.
reportErrors	boolean	Indicates if faults and errors from recipients should be sent back to the consumer. In such a case, only the first fault or error received will be reported. Note that if the consumer is synchronous, it will be blocked until all recipients successfully acked the exchange, or a fault or error is reported, and the exchange will be kept in the store for recovery.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
store	org.apache.servicemix.store.Store	Configure the store to use. If none is explicitely configured, the storeFactory will be used to create one.
storeFactory	org.apache.servicemix.store.StoreFactory	The store factory to use when creating a store. If no factory is explicitely defined, an in-memory only factory will be created.
target	org.apache.servicemix.eip.support.ExchangeTarget	The main target destination which will receive the exchange

timerManager	org.apache.servicemix.timers.TimerManager	The timer manager to use for this endpoint. If none is explicitely configured, a default implementation will be provided.
wsdlExchangeTarget	org.apache.servicemix.eip.support.ExchangeTarget	An exchange target pointing to a JBI endpoint that will be used to load the WSDL describing this endpoint. This can be used when the endpoint proxies another endpoint so that the same WSDL definition will be exposed."
wsdlResource	org.springframework.core.io.Resource	When specified, this spring resource will be used to load the WSDL that will be exposed as a description for this endpoint. This property can be used to explicitely define the WSDL to be exposed by this endpoint. This property takes precedence over the wsdlExchangeTarget property.

Pipeline

The Pipeline component is a bridge between an In-Only (or Robust-In-Only) MEP and an In-Out MEP. When the Pipeline receives an In-Only MEP, it will send the input in an In-Out MEP to the tranformer destination and forward the response in an In-Only MEP to the target destination.

The old org.apache.servicemix.components.util.PipelineComponent will be deprecated. This one offers the same feature but can be safely clustered and use in a transactional environment.

In the default configuration, faults sent by the transformer component are sent back to the consumer as faults if the exchange MEP supports them, or as errors (for InOnly exchanges). This behavior can be changed by setting the <code>sendFaultsToTarget</code> attribute to <code>true</code>, in which case faults will be sent to the target component, or by adding a <code>faultsTarget</code> element where faults should be sent.

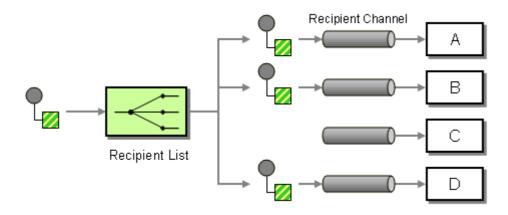

Property Name	Type	Description
copyAttachments	boolean	Should message attachments be copied ?
copyProperties	boolean	Should message properties be copied ?
endpoint	java.lang.String	The name of the endpoint.
faultsTarget	org.apache.servicemix.eip.support.ExchangeTarget	The address of the endpoint to send faults to
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
lockManager	org.apache.servicemix.common.locks.LockManager	The lock manager to use for this endpoint. If none is explicitely specified a default implementation will be provided.
sendFaultsToTarget	boolean	When the faultsTarget is not specified, faults may be sent to the target endpoint if this flag is set to <code>true</code>

service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
store	org.apache.servicemix.store.Store	Configure the store to use. If none is explicitely configured, the storeFactory will be used to create one.
storeFactory	org.apache.servicemix.store.StoreFactory	The store factory to use when creating a store. If no factory is explicitely defined, an in-memory only factory will be created.
target	<u>org.apache.servicemix.eip.support.ExchangeTarget</u>	The address of the target endpoint
timerManager	org.apache.servicemix.timers.TimerManager	The timer manager to use for this endpoint. If none is explicitely configured, a default implementation will be provided.
transformer	org.apache.servicemix.eip.support.ExchangeTarget	The adress of the in-out endpoint acting as a transformer
wsdlExchangeTarget	org.apache.servicemix.eip.support.ExchangeTarget	An exchange target pointing to a JBI endpoint that will be used to load the WSDL describing this endpoint. This can be used when the endpoint proxies another endpoint so that the same WSDL definition will be exposed."
wsdlResource	org.springframework.core.io.Resource	When specified, this spring resource will be used to load the WSDL that will be exposed as a description for this endpoint. This property can be used to explicitly define the WSDL to be exposed by this endpoint. This property takes precedence over the wsdlExchangeTarget property.

Static Recipeint List

The StaticRecipientList component will forward an input In-Only or Robust-In-Only exchange to a list of known recipients.

This component implements the <u>Recipient List</u> pattern, with the limitation that the recipient list is static.

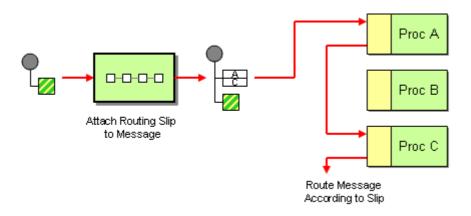

Property Name	Туре	Description
endpoint	java.lang.String	The name of the endpoint.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
lockManager	org.apache.servicemix.common.locks.LockManager	The lock manager to use for this endpoint. If none is explicitely specified a default implementation will be provided.
recipients	(org.apache.servicemix.eip.support.ExchangeTarget)*	A list of recipients that will each receive a copy of the input message.
reportErrors	boolean	Indicates if faults and errors from recipients should be sent back to the consumer. In such a case, only the first fault or error received will be reported. Note that if the consumer is synchronous, it will be blocked until all recipients successfully acked the exchange, or a fault or error is reported, and the exchange will be kept in the store for recovery.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
store	org.apache.servicemix.store.Store	Configure the store to use. If none is explicitely configured, the storeFactory will be used to create one.
storeFactory	org.apache.servicemix.store.StoreFactory	The store factory to use when creating a store. If no factory is explicitely defined, an in-memory only factory will be created.
timerManager	org.apache.servicemix.timers.TimerManager	The timer manager to use for this endpoint. If none is explicitely configured, a default implementation will be provided.
wsdlExchangeTarget	org.apache.servicemix.eip.support.ExchangeTarget	An exchange target pointing to a JBI endpoint that will be used to load the WSDL describing this endpoint. This can be used when the endpoint proxies another endpoint so that the same WSDL definition will be exposed."
wsdlResource	org.springframework.core.io.Resource	When specified, this spring resource will be used to load the WSDL that will be exposed as a description for this endpoint. This property can be used to explicitely define the WSDL to be exposed by this endpoint. This property takes precedence over the wsdlExchangeTarget property.

Static Routing Slip

A RoutingSlip component can be used to route an incoming In-Out exchange through a series of target services.

This component implements the <u>Routing Slip</u> pattern, with the limitation that the routing table is static.

This component only uses In-Out MEPs and errors or faults sent by targets are reported back to the consumer, thus interrupting the routing process.

Property Name	Type	Description
endpoint	java.lang.String	The name of the endpoint.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
lockManager	org.apache.servicemix.common.locks.LockManager	The lock manager to use for this endpoint. If none is explicitely specified a default implementation will be provided.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
store	org.apache.servicemix.store.Store	Configure the store to use. If none is explicitely configured, the storeFactory will be used to create one.
storeFactory	org.apache.servicemix.store.StoreFactory	The store factory to use when creating a store. If no factory is explicitely defined, an in-memory only factory will be created.
targets	(org.apache.servicemix.eip.support.ExchangeTarget)*	List of target endpoints used in the RoutingSlip
timerManager	org.apache.servicemix.timers.TimerManager	The timer manager to use for this endpoint. If none is explicitely configured, a default implementation will be provided.
wsdlExchangeTarget	org.apache.servicemix.eip.support.ExchangeTarget	An exchange target pointing to a JBI endpoint that will be used to load the WSDL describing this endpoint. This can be used when the endpoint proxies another

		endpoint so that the same WSDL definition will be exposed."
wsdlResource	org.springframework.core.io.Resource	When specified, this spring resource will be used to load the WSDL that will be exposed as a description for this endpoint. This property can be used to explicitely define the WSDL to be exposed by this endpoint. This property takes precedence over the wsdlExchangeTarget property.

Wire Tap

A WireTap component can be used to forward a copy of the input message to a listener in a proxy fashion.

This component implements the WireTap pattern.

It can handle all four standard MEPs, but will only send an In-Only MEP to the listener. The originating service must be configured to send messages to the WireTap directly. In the case of an In-Out MEP, this means that the WireTap needs to be configured to send the exchange along to the destination service.

Similar to the example above, the WireTap can also be used:

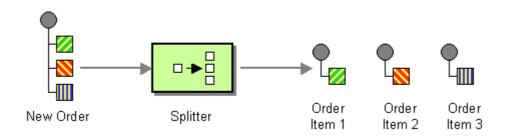

- to forward the output message of an exchange using <eip:outListener/>
- to forward the fault message of an exchange using <eip:faultListener/>

Property Name	Type	Description
copyProperties	boolean	If copyProperties is <code>true</code> , properties on the in message will be copied to the out / fault message before it is sent.
endpoint	java.lang.String	The name of the endpoint.
faultListener	org.apache.servicemix.eip.support.ExchangeTarget	The listener destination for fault messages
inListener	org.apache.servicemix.eip.support.ExchangeTarget	The listener destination for in messages

interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
lockManager	org.apache.servicemix.common.locks.LockManager	The lock manager to use for this endpoint. If none is explicitely specified a default implementation will be provided.
outListener	org.apache.servicemix.eip.support.ExchangeTarget	The listener destination for out messages
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
store	org.apache.servicemix.store.Store	Configure the store to use. If none is explicitely configured, the storeFactory will be used to create one.
storeFactory	org.apache.servicemix.store.StoreFactory	The store factory to use when creating a store. If no factory is explicitely defined, an in-memory only factory will be created.
target	org.apache.servicemix.eip.support.ExchangeTarget	The main target destination which will receive the exchange
timerManager	org.apache.servicemix.timers.TimerManager	The timer manager to use for this endpoint. If none is explicitely configured, a default implementation will be provided.
wsdlExchangeTarget	org.apache.servicemix.eip.support.ExchangeTarget	An exchange target pointing to a JBI endpoint that will be used to load the WSDL describing this endpoint. This can be used when the endpoint proxies another endpoint so that the same WSDL definition will be exposed."
wsdlResource	org.springframework.core.io.Resource	When specified, this spring resource will be used to load the WSDL that will be exposed as a description for this endpoint. This property can be used to explicitly define the WSDL to be exposed by this endpoint. This property takes precedence over the wsdlExchangeTarget property.

XPath Splitter

The XPathSplitter component implements the <u>Splitter</u> pattern using an xpath expression to split the incoming xml.

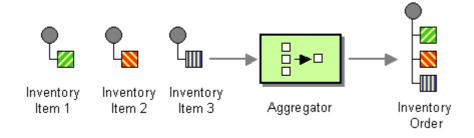

Property Name	Туре	Description
endpoint	java.lang.String	The name of the endpoint.
factory	javax.xml.xpath.XPathFactory	The XPath factory. If no factory is explicitely configured, a defaut one will be created using <pre><code>XPathFactory.newInstance()</code></pre>
forwardAttachments	boolean	Indicates if incoming attachments should be forwarded with the new exchanges.
forwardProperties	boolean	Indicates if properties on the incoming message should be forwarded.
functionResolver	javax.xml.xpath.XPathFunctionResolver	The function resolver.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
lockManager	org.apache.servicemix.common.locks.LockManager	The lock manager to use for this endpoint. none is explicitely specified a default implementation will be provided.
namespaceContext	javax.xml.namespace.NamespaceContext	The namespace context to use when evaluating the xpath expression
reportErrors	boolean	Indicates if faults and errors from splitted parts should be sent back to the consumer. In such a case, only the first fault or error received will be reported. Note that if the consumer is synchronous, it will be blocked until all parts have been successfully acked or a fault or error is reported, and the exchange will be kept in the store for recovery.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
store	org.apache.servicemix.store.Store	Configure the store to use. If none is explicitely configured, the storeFactory will be used to create one.
storeFactory	org.apache.servicemix.store.StoreFactory	The store factory to use when creating a store. If no factory is explicitely defined, an in-memory only factory will be created.
synchronous	boolean	Specifies wether exchanges for all parts are sent synchronously or not.
target	org.apache.servicemix.eip.support.ExchangeTarget	The address of the target endpoint.
timerManager	org.apache.servicemix.timers.TimerManager	The timer manager to use for this endpoint If none is explicitely configured, a default implementation will be provided.
variableResolver	org.apache.servicemix.expression.MessageVariableResolver	The variable resolver. The default one will enable the use of properties on the message, exchange, as well as making system properties and environment properties available.
wsdlExchangeTarget	org.apache.servicemix.eip.support.ExchangeTarget	An exchange target pointing to a JBI endpoint that will be used to load the WSDI describing this endpoint. This can be used when the endpoint proxies another endpoint so that the same WSDL definition will be exposed."
wsdlResource	org.springframework.core.io.Resource	When specified, this spring resource will be used to load the WSDL that will be exposed as a description for this endpoint. This property can be used to explicitly define the WSDL to be exposed by this endpoint.

		This property takes precedence over the wsdlExchangeTarget property.
xpath	java.lang.String	The xpath expression used to split the input message.

Split Aggregator

The SplitAggregator is an aggregator mainly usefull to collect messages that have been created using a splitter.

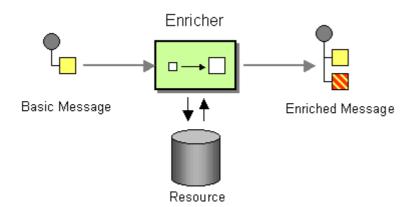

It relies on several properties that should be set on the exchanges (count, index, correlationId).

Endpoint properties

Content Enricher

With a Content Enricher you can extract additional information from a source and add this information to your message. This is useful if the calling service for example extracts a 'userlD' and your target system is only aware of a 'userName'. By using the Content-Enricher you could extract this information from a source system and add this additional information ('userName') to your message.

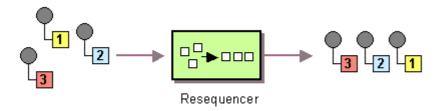

```
<eip:content-enricher service="test:contentEnricher" endpoint="endpoint">
    <eip:enricherTarget>
        <eip:exchange-target service="test:additionalInformationExtracter" />
        </eip:enricherTarget>
        <eip:target>
        <eip:exchange-target service="test:myTarget" />
        </eip:target>
        </eip:content-enricher>
```

Property Name	Туре	Description
copyAttachments	boolean	If this is set to <code>true</code> , message attachments from the incoming exchange and the enricher exchange will be copied to the outgoing message exchange. The default value is <code>false</code> (do not copy message atachments).
copyProperties	boolean	If this is set to <code>true</code> , message properties from the incoming exchange and the enricher exchange will be copied to the outgoing message exchange. The default value is <code>false</code> (do not copy message properties).
endpoint	java.lang.String	The name of the endpoint.
enricherElementName	javax.xml.namespace.QName	returns the QName of the resulting root node
enricherTarget	org.apache.servicemix.eip.support.ExchangeTarget	The target that will receive a copy of the input message and return an additional content.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
lockManager	org.apache.servicemix.common.locks.LockManager	The lock manager to use for this endpoint. If none is explicitely specified a default implementation will be provided.
requestElementName	javax.xml.namespace.QName	Returns the QName of the element which contains the 'IN Message' within the response message
resultElementName	javax.xml.namespace.QName	Returns the QName of the element which contains the message which was produced by the enricherTarget within the response message
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
store	org.apache.servicemix.store.Store	Configure the store to use. If none is explicitely configured, the storeFactory will be used to create one.
storeFactory	org.apache.servicemix.store.StoreFactory	The store factory to use when creating a store. If no factory is explicitely defined, an in-memory only factory will be created.
target	org.apache.servicemix.eip.support.ExchangeTarget	The target where the enriched exchanges are sent.
timerManager	org.apache.servicemix.timers.TimerManager	The timer manager to use for this endpoint. If none is explicitely configured, a default implementation will be provided.
wsdlExchangeTarget	org.apache.servicemix.eip.support.ExchangeTarget	An exchange target pointing to a JBI endpoint that will be used to load the WSDL describing this

		endpoint. This can be used when the endpoint proxies another endpoint so that the same WSDL definition will be exposed."
wsdlResource	org.springframework.core.io.Resource	When specified, this spring resource will be used to load the WSDL that will be exposed as a description for this endpoint. This property can be used to explicitely define the WSDL to be exposed by this endpoint. This property takes precedence over the wsdlExchangeTarget property.

Eip Resequencer

A resequencer re-orders incoming In-Only or Robust-In-Only exchanges and sends them synchronously to a targets service. Synchronous sending ensures that messages arrive in correct order at the target service. This component implements the <u>Resequencer</u> pattern.

It works on (continuous) streams of message exchanges using a timeout policy. Since the resequencer doesn't make batch reads there's no need to know the number of messages to be reordered in advance (although a capacity parameter prevents the resequencer from running out of memory). If the maximum out-of-sequence time difference between messages in a message stream is known, the resequencer's timeout parameter should be set to this value (milliseconds). In this case it is guaranteed that all elements of a stream are delivered in correct order to the target service. The lower the timeout value is compared to the out-of-sequence time difference the higher is the probability for out-of-sequence messages sent by this resequencer. Large timeout values should be supported by sufficiently high capacity values.

For comparing elements of a sequence the resequencer component can be configured with a sequence element comparator. A default comparator is provided that compares message exchanges based on <code>Long</code> sequence numbers. This comparator expects the sequence number to be the value of the <code>org.apache.servicemix.eip.sequence.number</code> property of the exchanges's <code>in\-</code> NormalizedMessage. The name of the property can be customized in the comparator configuration (see below). You may also provide a custom comparator by implementing the <code>SequenceElementComparator</code> interface.

A running example can be downloaded from here. In this example, a custom-coded message sender sends messages in "wrong" order to the resequencer. The resequencer re-orders these messages and (synchronously) sends them to a file sender-endpoint. The file sender-enpoint writes the messages (in proper order) to the work/output directory.

Property Name	Туре	Description
capacity	int	The capacity of this resequencer. The capacity determines the maximum number of message that will be kept in memory to put the messages back in sequence. This determine how far two messages can be in the list of messages while still being put back in sequence.
comparator	org.apache.servicemix.eip.support.resequence.SequenceElementComparator	The comparator used to determine the sequence order of elements.
endpoint	java.lang.String	The name of the endpoint.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
lockManager	org.apache.servicemix.common.locks.LockManager	The lock manager to use for this endpoint. If none is explicitely specified a default implementation will be provided.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
store	org.apache.servicemix.store.Store	Configure the store to use. If none is explicitely

		configured, the storeFactory will be
storeFactory	org.apache.servicemix.store.StoreFactory	used to create one. The store factory to use when creating a store. If no factory is explicitely defined, an inmemory only factory will be created.
target	org.apache.servicemix.eip.support.ExchangeTarget	
timeout	long	Set the timeout of this resequencer. This specifies the maximum number of milliseconds that can elapse between two out-of-sync messages.
timerManager	org.apache.servicemix.timers.TimerManager	The timer manager to use for this endpoint. If none is explicitely configured, a default implementation will be provided.
wsdlExchangeTarget	org.apache.servicemix.eip.support.ExchangeTarget	An exchange target pointing to a JBI endpoint that will be used to load the WSDL describing this endpoint. This can be used when the endpoint proxies another endpoint so that the same WSDL definition will be exposed."
wsdlResource	org.springframework.core.io.Resource	When specified, this spring resource will be used to load the WSDL that will be exposed as a description for this endpoint. This property can be used to explicitely define the WSDL to be exposed by this endpoint. This property takes precedence over the wsdlExchangeTarget property.

Async Bridge

The AsyncBridge expects an InOut mep as input. It then uses the exchange id of the InOut mep as the correlation id and creates an InOnly message by copying the input message and sends it to the target (with the correlation id set as a property). Next it expects an InOnly to come back with the

same correlation id property. When this happens, the message is copied to the out message of the original exchange and sent back. If no response is received during the configured amount of time (timeout property in milliseconds), an error will be sent back to the original consumer.

```
<eip:async-bridge
service="sample:AsyncBridge"
endpoint="AsyncBridgeEndpoint"
<eip:target>
    <eip:exchange-target service="sample:SampleTarget" />
    </eip:target>
</eip:async-bridge>
```

Correlation Id

There is a convention between the AsyncBridge and the target on how the correlation id is transmitted. The correlation id can only be transmitted from the AnsycBridge to the target using a message property . The property name can be customized. On the other hand, the correlation id coming back from the target could be set in a message property or the message payload. The AsyncBridge could use an Expression to extract the correlation id from the message returning from the target.

As you can see from the sample above the responseCorrldProperty is used to set the name of the property that the target will query to get the correlation id sent by the AsyncBridge. In other words, the target will do something like this to extract the correlation id

```
String correlationId = exchange.getProperty("correlationIdProperty");
```

The responseCorrld is set with an instance of type org.apache.servicemix.expression.Expression, in this case the class org.apache.servicemix.expression.JAXPStringXPathExpression. This expression resolves the location of the correlation id coming back from the target. In the above example the expression shows that the correlation id comes as part of the message payload in an attribute called "corrld" of the /my-response/message element. In a similar manner the class org.apache.servicemix.expression.PropertyExpression could have been used to locate the correlation id in a message property.

Property Name	Туре	Description
endpoint	java.lang.String	The name of the endpoint.

interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
lockManager	org.apache.servicemix.common.locks.LockManager	The lock manager to use for this endpoint. If none is explicitely specified a default implementation will be provided.
requestCorrld	org.apache.servicemix.expression.Expression	The expression used to compute the correlation id used to correlate the response and the request. The default behavior is to use the exchange id of the incoming In-Out exchange as the correlation id.
responseCorrld	org.apache.servicemix.expression.Expression	The expression used to compute the correlation id from the response exchange. The value computed by this expression must match the one from the {@link #setRequestCorrld} expression. The default value is null, but if no specific expression is configured, an expression will be created which will extract the response correlation id from the {@link #setResponseCorrldProperty(String)} property on the exchange.
responseCorrldProperty	java.lang.String	Name of the property used by default to compute the correlation id on the response exchange.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
store	org.apache.servicemix.store.Store	Configure the store to use. If none is explicitely configured, the storeFactory will be used to create one.
storeFactory	org.apache.servicemix.store.StoreFactory	The store factory to use when creating a store. If no factory is explicitely defined, an in-memory only factory will be created.
target	org.apache.servicemix.eip.support.ExchangeTarget	The target which will be used to send an In-Only or Robust-In-Only exchange to. When receiving an In-Out exchange, the async bridge will create an In-Only request and send it to the specified target. It then expects another In-Only exchange to come back as the response, which will be set as the Out message on the In-Out exchange. This property is mandatory and must be set to a valid target.
timeout	long	The timeout property controls the amount of time that the async bridge will wait for the response after having sent the request. The default value is 0 which means that no timeout apply. If set to a non zero value, a timer will be started when after the request is sent. When the timer expires, the In-Out exchange will be sent back with an error status and a {@link java.util.concurrent.TimeoutException} as the cause of the error. The value represents the number of milliseconds to wait.

timerManager	org.apache.servicemix.timers.TimerManager	The timer manager to use for this endpoint. If none is explicitely configured, a default implementation will be provided.
useRobustInOnly	boolean	Boolean flag to control if In-Only or Robust-In-Only exchange should be used when sending the request. The default value is <code>false</code> which means that an In-Only exchange will be used. When using a Robust-In-Only exchange and when a fault is received, this fault will be sent back to the consumer on the In-Out exchange and the response exchange (if any) would be discarded. For both In-Only and Robust-In-Only, if the request exchange comes back with an Error status, this error will be conveyed back to the consumer in the same way.
wsdlExchangeTarget	org.apache.servicemix.eip.support.ExchangeTarget	An exchange target pointing to a JBI endpoint that will be used to load the WSDL describing this endpoint. This can be used when the endpoint proxies another endpoint so that the same WSDL definition will be exposed."
wsdlResource	org.springframework.core.io.Resource	When specified, this spring resource will be used to load the WSDL that will be exposed as a description for this endpoint. This property can be used to explicitely define the WSDL to be exposed by this endpoint. This property takes precedence over the wsdlExchangeTarget property.

Tips

ExchangeTarget

All patterns use the **<exchange-target** /> tag to specify the target of a JBI exchange. This element has the following attributes:

Name	Type	Description
interface	QName	the QName of the target interface. One of service or interface attribute is required
operation	QName	the QName of the target operation (optional)
service	QName	the QName of the target service. One of service or interface attribute is required
endpoint	String	the name of the target JBI endpoint, only used when service is set
uri	String	uri used to target the exchange (see <u>URIs</u>)

NamespaceContext

Some patterns use XPath expression. To use such expressions on an xml with namespaces, you need to define a NamespaceContext.

This NamespaceContext can be referenced by a **namespaceContext** attribute as shown in the XPathSplitter or MessageFilter examples.

Predicates

Some patterns uses predicates to test a given JBI exchange. The only predicate currently implemented is the XPathPredicate, but you can implement your own and deploy it with the service unit.

Configuring temporary message storage

Many of the pattern implementation need to store MessageExchanges temporarily. An example: the aggregator will need to keep track of the MessageExchange it is aggregating. By default, the EIPs use a plain MemoryStoreFactory to create in-memory stores, but there are other options. If you set the timeout property on the MemoryStoreFactory, it will evict old object from the in-memory store to avoid a memory leak. You can also use a JDBCStoreFactory to store data in a database instead of in memory.

Example: to use an in-memory store with timeout for a storing active and closed aggregations in a <split-aggregator/>, you can do

Creating your own patterns

Some classes have been designed to be extensible, this includes:

- org.apache.servicemix.eip.support.AbstractAggregator
- org.apache.servicemix.eip.support.AbstractSplitter

2.7. servicemix-exec

Overview

The ServiceMix Exec component is used to invoke commands (executables, binaries, shell commands, shell scripts, etc). The command can be static (defined in the endpoint attributes) or dynamic (provided in the incoming message, including arguments).

Namespace and xbean.xml

The namespace URI for the servicemix-exec component is http://servicemix.apache.org/exec/1.0. The is an example of <filename>xbean.xml</filename> with a namespace definition with prefix exec.

```
<beans xmlns:exec="http://servicemix.apache.org/exec/1.0">
    <!-- add exec:endpoint definitions here -->
</beans>
```

Endpoints types

The ServiceMix Exec component only defines one endpoint, called exec:endpoint.

Endpoint exec: endpoint

Endpoint properties

Property Name	Туре	Description
command	java.lang.String	This attribute specifies the default command to use if no is provided in the incoming message. <i> nbsp; he default value is <code>null</code>.</i>
endpoint	java.lang.String	The name of the endpoint.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
marshaler	org.apache.servicemix.exec.marshaler.ExecMarshalerSupport	With this method you can specify a marshaler class which provides the logic for converting a message into a execution command. This class has to implement the interface class <code>ExecMarshalerSupport</code> . If you don't specify a marshaler, the <code>DefaultExecMarshaler</code> will be used.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
wsdl	org.springframework.core.io.Resource	This attribute specifies the abstract WSDL describing the endpoint behavior.

Abstract WSDL

TODO

How it works

TODO

2.8. servicemix-file

Overview

The ServiceMix File component provides JBI integration to the file system. It can be used to read & write files via URI or to periodically poll directories for new files.

Namespace and xbean.xml

The namespace URI for the servicemix-bean JBI component is http://servicemix.apache.org/file/1.0. This is an example of an xbean.xml file with a namespace definition with prefix bean.

```
<beans xmlns:file="http://servicemix.apache.org/file/1.0">
  <!-- add file:poller and file:sender definitions here -->
</beans>
```

Endpoint types

The servicemix-file component defines two endpoint type:

- file:poller:: Periodically polls a directory for files and sends an exchange for every file
- file:sender:: Writes the contents of an exchange to a file

file:poller

Property Name	Type	Description
archive	java.io.File	Specifies a directory relative to the polling director archived.
autoCreateDirectory	boolean	Specifies if the endpoint should create the target d exist. If you set this to <code>false</code> and t the endpoint will not do anything. Default value is
comparator	java.util.Comparator	Specifies a <code>Comparator</code> which will before starting to process. The default is null, mea <code>Comparator</code> objects are implemen <code>java.util.Comparator</code> .
component	org.apache.servicemix.common.DefaultComponent	
concurrentPolling	boolean	Sets whether more than one poll can be active at a Default value is <code>false</code> .
delay	long	Sets the amount of time in milliseconds that the er making the first poll.
deleteFile	boolean	Specifies if files should be deleted after they are pr <code>true</code> .
endpoint	java.lang.String	The name of the endpoint.
file	java.io.File	Specifies the file or directory to be polled. If it is a directory or its sub-directories will be processed b only files matching the filename will be processed.
filter	java.io.FileFilter	Bean defining the class implementing the file filter be an implementation of the <code>java.io.FileFilt</code>
firstTime	java.util.Date	Sets the date on which the first poll will be execute <code>setDelay</code> , the delay interval will be specified.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the
lockManager	org.apache.servicemix.common.locks.LockManager	Bean defining the class implementing the file locking be an implementation of the <code>org.apache.servicemix.locks.LockManagerathis will be set to an instances of <code>org.apache.servicemix.common.locks.impl</code></code>

marshaler	org.apache.servicemix.components.util.FileMarshaler	Specifies a <code>FileMarshaler</code> object th the NMR. The default file marshaller can read valid <code>FileMarshaler</code> objects are impleme <code>org.apache.servicemix.components.util.File</code>
maxConcurrent	int	How many open exchanges can be pending. Defaul pending exchanges. Set to 1n to engage throttlin
period	long	Sets the number of milliseconds between polling at
recursive	boolean	Specifies if sub-directories are polled; if false then specified directory. If the endpoint is configured to than a directory then this attribute is ignored. Defa
scheduler	org.apache.servicemix.common.scheduler.Scheduler	Set a custom Scheduler implementation if you need over the polling schedule.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exp
serviceUnit	org.apache.servicemix.common.ServiceUnit	
targetEndpoint	java.lang.String	the name of the endpoint to which requests are ser
targetInterface	javax.xml.namespace.QName	the QName of the interface to which requests are s
targetOperation	javax.xml.namespace.QName	the QName of the operation to which requests are
targetService	javax.xml.namespace.QName	the QName of the service to which requests are ser
targetUri	java.lang.String	Set the target service/endpoint/interface using a U

file:sender

Property Name	Type	Description
append	boolean	Specifies if the endpoint appends data to existing overwrite existing files. The default is for the endpexisting files. Setting this to <code>true</code> endpoint to append data. Default value is <code>tode>tode>tode>tode>tode>tode>tode>t</code>
autoCreateDirectory	boolean	Specifies if the endpoint should create the target d not exist. If you set this to <code>false</code> a does not exist, the endpoint will not do anything. I <code>true</code> .
component	org.apache.servicemix.file.FileComponent	
directory	java.io.File	Specifies the directory where the endpoint writes f
endpoint	java.lang.String	The name of the endpoint.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the
marshaler	org.apache.servicemix.components.util.FileMarshaler	Specifies a <code>FileMarshaler</code> object the message data from the NMR into a file. The default write valid XML data. <code>FileMarshalerorg.apache.servicemix.components.util.File</code>
overwrite	boolean	Specifies if the endpoint overwrites existing files of the endpoint to not overwrite existing files. Set <code>true</code> instructs the endpoint to over Default value is <code>false</code> .
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exp
tempFilePrefix	java.lang.String	Specifies a string to prefix to the beginning of gen
tempFileSuffix	java.lang.String	Specifies a string to append to generated file name

2.9. servicemix-ftp

Overview

The ServiceMix FTP component provides JBI integration to the FTP servers. It can be used to read & write files over FTPor to periodically poll directories for new files.

Namespace and xbean.xml

The namespace URI for the servicemix-bean JBI component is http://servicemix.apache.org/ftp/1.0. This is an example of an xbean.xml file with a namespace definition with prefix bean.

```
<beans xmlns:ftp="http://servicemix.apache.org/ftp/1.0">
  <!-- add ftp:poller and ftp:sender definitions here -->
</beans>
```

Endpoint types

The servicemix-ftp component defines two endpoint type:

- ftp:poller:: Periodically polls a directory on an FTP server for files and sends an exchange for every file
- ftp:sender:: Writes the contents of an exchange to a file on an FTP server

ftp:poller

Property Name	Туре	Description
archive	java.net.URI	Specifies a directory relative to the polling directory to which processed files are archived.
autoCreateDirectory	boolean	Specifies if the endpoint should create the target directory, if it does not already exist. If you set this to <code>false</code> and the directory does not exist, the endpoint will not do anything. Default value is <code>true</code> .
changeWorkingDirectory	boolean	When set to <code>true</code> , the poller will do an explicit <code>cwd</code> into the directory to be polled. Default to <code>false</code> . Recursive polling will not be possible if this feature is enabled.
clientPool	org.apache.servicemix.ftp.FTPClientPool	Set a custom FTPClientPool. If this property has not been set,

		the FTP client pool will be created based on the information provided in the URI.
component	org.apache.servicemix.common.DefaultComponent	the <code>component</code> implementation to use
concurrentPolling	boolean	Sets whether more than one poll can be active at a time (true means yes). Default value is <code>false</code> .
delay	long	Sets the amount of time in milliseconds that the endpoint should wait before making the first poll.
deleteFile	boolean	Delete the file after it has been succesfully processed? Defaults to <code>true</code>
endpoint	java.lang.String	The name of the endpoint.
filter	java.io.FileFilter	Sets the filter to select which files have to be processed. When not set, all files will be picked up by the poller.
firstTime	java.util.Date	Sets the date on which the first poll will be executed. If a delay is also set using <code>setDelay</code> , the delay interval will be added after the date specified.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
lockManager	org.apache.servicemix.common.locks.LockManager	Set a custom LockManager implementation for keeping track of which files are already being processed. The default implementation is a simple, in-memory lock management system.
marshaler	org.apache.servicemix.components.util.FileMarshaler	Set a custom FileMarshaler implementation to control how the file contents is being translated into a JBI message. The default implementation reads XML contents from the file.
period	long	Sets the number of milliseconds between polling attempts.
recursive	boolean	Specifies whether subdirectories should be polled. Defaults to <code>true</code>
scheduler	org.apache.servicemix.common.scheduler.Scheduler	Set a custom Scheduler implementation if you need more fine-grained control over the polling schedule.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
serviceUnit	org.apache.servicemix.common.ServiceUnit	

stateless	boolean	When set to <code>false</code>
targetEndpoint	java.lang.String	the name of the endpoint to which requests are sent
targetInterface	javax.xml.namespace.QName	the QName of the interface to which requests are sent
targetOperation	javax.xml.namespace.QName	Set the operation to be invoked on the target service.
targetService	javax.xml.namespace.QName	the QName of the service to which requests are sent
targetUri	java.lang.String	Set the target service/ endpoint/interface using a URI.
uri	java.net.URI	Configures the endpoint from a URI.

ftp:sender

Property Name	Туре	Description
autoCreateDirectory	boolean	Specifies if the endpoint should create the target directory, if it does not already exist. If you set this to <code>false</code> and the directory does not exist, the endpoint will not do anything. Default value is <code>true</code> .
checkDuplicates	boolean	Specifies whether duplicates should be checked. Defaults to <code>true</code> .
clientPool	org.apache.servicemix.ftp.FTPClientPool	Set a custom FTPClientPool. If this property has not been set, the FTP client pool will be created based on the information provided in the URI.
component	org.apache.servicemix.ftp.FtpComponent	
endpoint	java.lang.String	The name of the endpoint.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
marshaler	org.apache.servicemix.components.util.FileMarshaler	Set a custom FileMarshaler implementation to control how the file contents is being translated into a JBI message. The default implementation reads XML contents from the file.
overwrite	boolean	Specifies if a file with the same name already exists on the FTP server, the file should be overwritten. Defaults to <code>false</code> .
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
uniqueFileName	java.lang.String	Sets the name used to make a unique name if no file name is available on the message.

uploadPrefix	java.lang.String	Set the file name prefix used during upload. The prefix will be automatically removed as soon as the upload has completed. This allows other processes to discern completed files from files that are being uploaded.
uploadSuffix	java.lang.String	Set the file name suffix used during upload. The suffix will be automatically removed as soon as the upload has completed. This allows other processes to discern completed files from files that are being uploaded.
uri	java.net.URI	Configures the endpoint from a URI

Examples

Using ftp:pool to configure the FTP connections

In order to gain more control over the FTP connection parameters (active/passive, timeout, ...) that are being used, you can define your own FTP connection pool. Afterward, you can refer to the pool object from both a sender and poller endpoint.

The table below shows the full list of options offered by ftp:pool:

Property Name	Туре	Description
address	java.net.InetAddress	Set the remote internet address to connect to.
binaryMode	boolean	Use binary mode transfers. Defaults to <code>true</code> .
config	org.apache.commons.net.ftp.FTPClientConfig	Configure a custom FTPClientConfig instance to allow more fine-grained control over the FTP connections in the pool.
controlEncoding	java.lang.String	Configure the encoding used in the FTP control connections. Defaults to <code>ISO-8859-1</code>
dataTimeout	int	Specifies a timeout used on the FTP data connection. Defaults to <code>120000</code>
host	java.lang.String	Set the remote host name to connect to.
localAddress	java.net.InetAddress	Set the local IP address to be used when establishing the connection.
localPort	int	Set the local TCP/IP port to be used when establishing the connection.

passiveMode	boolean	Use passive mode FTP transfers. Defaults to <code>false</code>
password	java.lang.String	Set the password for logging into the FTP server.
pool	org.apache.commons.pool.ObjectPool	Set a custom ObjectPool instance to use for the connection pooling.
port	int	Set the remote port number to connect to.
username	java.lang.String	Set the login to use to access the FTP server.

If you need even more fine-grained control over the FTP connections or the way the payloads are being handled, have a look at the <u>Camel FTP</u> component, which offers a lot of options out of the box, but also allows setting any property on its underlying Commons NET <u>FTPClient</u> and <u>FTPClientConfig</u> instances.

2.10. servicemix-http

Overview

ServiceMix ships with a JBI compliant HTTP/SOAP binding component named servicemix-http.

Here are the main features:

- JBI compliant Binding Component
- · Usable in a lightweight mode in servicemix.xml configuration files
- Integrated HTTP server based on Jetty 6
- · HTTP Client using Jakarta Commons HTTP Client
- Highly performant and scalable using Jetty 6 continuations
- SOAP 1.1 and 1.2 support
- MIME attachments
- WS-Addressing support
- · WSDL based and XBean based deployments
- · Support for all MEPs as consumers or providers
- SSL support
- WS-Security support

Namespace and xbean.xml

The namespace URI for the servicemix-bean JBI component is http://servicemix.apache.org/http/1.0. This is an example of an xbean.xml file with a namespace definition with prefix bean.

```
<beans xmlns:http="http://servicemix.apache.org/http/1.0">
    <!-- add http:consumer, http:soap-consumer
          http:provider and http soap:provider definitions here -->
</beans>
```

Endpoint types

The servicemix-http component defines four endpoint type:

- http:consumer :: This endpoint allows you to expose a service in the ESB to the outside world over HTTP. Whenever it receives an HTTP request, it will interact with the configured services on the ESB to provide the HTTP response.
- http:soap-consumer :: Similar to http:consumer, but specifically geared towards handing
 SOAP requests and responses
- http:provider:: This endpoint allows you to access remote services from within the ESB. It will perform an external HTTP request whenever it receives a JBI MessageExchange
- http:soap-provider:: Similar to http:provider, but specifically geared towards performing SOAP requests

It also provides one additional legacy endpoints, which are still available to ease migration from ServiceMix 3:

 http:endpoint :: (Deprecated) Legacy endpoint, capable to acting as a consumer or provider based on the configuration

http:endpoint

Property Name	Туре	Description
authMethod	java.lang.String	a string naming the scheme used for authenticating users
basicAuthentication	org.apache.servicemix.http.BasicAuthCredentials	authentication data for using basic HTTP authentication.
binding	javax.wsdl.extensions.ExtensibilityElement	
defaultMep	java.net.URI	
defaultOperation	javax.xml.namespace.QName	
description	org.w3c.dom.Document	
dynamic	boolean	
endpoint	java.lang.String	The name of the endpoint.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
locationURI	java.lang.String	the URI to which a provider endpoint sends requests

policies	(java.lang.Object)*	
proxy	org.apache.servicemix.http.ProxyParameters	configuration used to establish a proxy for sending HTTP requests. This configuration overrides that which is set at the component level.
responseContentTypeCheck	boolean	Specifies if the http provider checks the response content type for the
role	java.lang.String	HTTP endpoints can be either consumers or providers. Specifying
roleAsString	java.lang.String	
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
soap	boolean	
soapAction	java.lang.String	
soapVersion	java.lang.String	
ssi	org.apache.servicemix.http.SslParameters	a bean containing the SSL configuration properties
synchronous	boolean	
targetEndpoint	java.lang.String	
targetInterfaceName	javax.xml.namespace.QName	
targetService	javax.xml.namespace.QName	
timeout	int	the number of milliseconds before the endpoint times out. The default value is 0 which means that the endpoint will never timeout.
wantContentTypeHeaderFromExchangeIntoHttpRequest	boolean	Specifies if the HTTP provider will copy the HTTP request headers into the JBI

http:consumer

Endpoint properties

Property Name	Туре	Description
authMethod	java.lang.String	a string naming the scheme used for authenticating users
component	org.apache.servicemix.common.DefaultComponent	
defaultMep	java.net.URI	a URI representing the endpoint's default MEP. The default is
endpoint	java.lang.String	The name of the endpoint.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
locationURI	java.lang.String	the URI at which the endpoint listens for requests
marshaler	org.apache.servicemix.http.endpoints.HttpConsumerMarshaler	the bean used to marshal HTTP messages. The default is a
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
serviceUnit	org.apache.servicemix.common.ServiceUnit	
ssl	org.apache.servicemix.http.SslParameters	a bean containing the SSL configuration properties
targetEndpoint	java.lang.String	the name of the endpoint to which requests are sent
targetInterface	javax.xml.namespace.QName	the QName of the interface to which requests are sent
targetOperation	javax.xml.namespace.QName	the QName of the operation to which requests are sent
targetService	javax.xml.namespace.QName	the QName of the service to which requests are sent
targetUri	java.lang.String	Set the target service/ endpoint/interface using a URI.
timeout	long	the timeout is specified in milliseconds. The default value is 0 which

http:provider

Property Name	Туре	Description
clientSoTimeout	int	the number of milliseconds the endpoint will block while attempting to read a request. The default value is 60000. Setting this to 0 specifies that the endpoint will never timeout.

component	org.apache.servicemix.common.DefaultComponent	
credentials	java.lang.String	The authentication credentials
endpoint	java.lang.String	The name of the endpoint.
expectGzippedResponse	boolean	If true, the accept- encoding http header will be set to gzip and the response will be un-gzipped.
gzipRequest	boolean	If true, the request content will be gzipped and sent over the wire. The content-encoding http header will also be set to gzip.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
locationURI	java.lang.String	the URI to which the endpoint sends requests
marshaler	org.apache.servicemix.http.endpoints.HttpProviderMarshaler	the bean used to marshal HTTP messages. The default is a
principal	java.lang.String	The authentication principal
providerExpirationTime	int	the number of milliseconds to wait for a response before expiring.
proxyHost	java.lang.String	the host name of the HTTP proxy
proxyPassword	java.lang.String	the password for the HTTP proxy authentication
proxyPort	int	the host port of the HTTP proxy (defaults to 80)
proxyUsername	java.lang.String	the user name for the HTTP proxy authentication
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
serviceUnit	org.apache.servicemix.common.ServiceUnit	
ssl	org.apache.servicemix.http.SslParameters	the SSL parameters

http:soap-consumer

Property Name	Туре	Description
authMethod	java.lang.String	a string naming the scheme used for authenticating users

component	org.apache.servicemix.common.DefaultComponent	
defaultMep	java.net.URI	a URI representing the endpoint's default MEP. The default is

targetOperation	javax.xml.namespace.QName	the QName of the operation to which requests are sent
targetService	javax.xml.namespace.QName	the QName of the service to which requests are sent
targetUri	java.lang.String	Set the target service/ endpoint/interface using a URI.
timeout	long	the timeout is specified in milliseconds. The default value is 0 which
useJbiWrapper	boolean	Specifies if the JBI wrapper is sent in the body of the message. Default is
validateWsdl	boolean	Specifies if the WSDL is checked for WSI-BP compliance. Default is <code>true</code> .
wsdl	org.springframework.core.io.Resource	the URL of the WSDL document defining the endpoint's messages

http:soap-provider

Property Name	Туре	Description
clientSoTimeout	int	the number of milliseconds the endpoint will block

		while attempting to read a request. The default value is 60000. Setting this to 0 specifies that the endpoint will never timeout.
component	org.apache.servicemix.common.DefaultComponent	
credentials	java.lang.String	The authentication credentials
endpoint	java.lang.String	The name of the endpoint.
expectGzippedResponse	boolean	If true, the accept- encoding http header will be set to gzip and the response will be un-gzipped.
gzipRequest	boolean	If true, the request content will be gzipped and sent over the wire. The content-encoding http header will also be set to gzip.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
locationURI	java.lang.String	the URI to which the endpoint sends requests
marshaler	org.apache.servicemix.http.endpoints.HttpProviderMarshaler	the bean used to marshal HTTP messages. The default is a
policies	(org.apache.servicemix.soap.api.Policy)*	a list of interceptors that will process messages
principal	java.lang.String	The authentication principal
providerExpirationTime	int	the number of milliseconds to wait for a response before expiring.
proxyHost	java.lang.String	the host name of the HTTP proxy
proxyPassword	java.lang.String	the password for the HTTP proxy authentication
proxyPort	int	the host port of the HTTP proxy (defaults to 80)
proxyUsername	java.lang.String	the user name for the HTTP proxy authentication
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
serviceUnit	org.apache.servicemix.common.ServiceUnit	
ssl	org.apache.servicemix.http.SslParameters	the SSL parameters

useJbiWrapper	boolean	Specifies if the JBI wrapper is sent in the body of the message. Default is
validateWsdl	boolean	Specifies if the WSDL is checked for WSI-BP compliance. Default is <code>true</code>
wsdl	org.springframework.core.io.Resource	the URL of the WSDL document defining the endpoint's messages

2.11. servicemix-jms

Overview

ServiceMix ships with a JBI compliant JMS binding component named servicemix-jms.

Here are the main features:

- JBI compliant Binding Component
- · Usable in a lightweight mode in servicemix.xml configuration files
- SOAP 1.1 and 1.2 support
- MIME attachments
- WS-Addressing support
- · WSDL based and XBean based deployments
- · Support for all MEPs as consumers or providers

Namespace and xbean.xml

The namespace URI for the servicemix-bean JBI component is http://servicemix.apache.org/jms/1.0. This is an example of an xbean.xml file with a namespace definition with prefix bean.

Endpoint types

The servicemix-jms component defines six endpoint type:

- jms:consumer:: This endpoint allows you to expose a service in the ESB to the outside world over JMS. Whenever it receives a JMS message, it will interact with the configured services on the ESB.
- jms:soap-consumer:: Similar to jms:consumer, but specifically geared towards handing SOAP requests and responses

- jms:jca-consumer :: Similar to jms:consumer, but adds the possibility of using a JCA resource adapter
- jms:provider:: This endpoint allows you to access remote services from within the ESB. It will send a JMS message whenever it receives a JBI MessageExchange
- jms:soap-provider:: Similar to jms:provider, but specifically geared towards performing SOAP requests
- jms:jca-provider:: Similar to jms:provider, but adds the possibility of using a JCA resource adapter

It also provides one additional legacy endpoints, which are still available to ease migration from ServiceMix 3:

• jms:endpoint :: (Deprecated) Legacy endpoint, capable to acting as a consumer or provider based on the configuration

jms:endpoint

Property Name	Туре	Description
activationSpec	javax.resource.spi.ActivationSpec	The ActivationSpec to use on a JCA consumer endpoint.
bootstrapContext	javax.resource.spi.BootstrapContext	The BootstrapContext to use for a JCA consumer endpoint.
connectionFactory	javax.jms.ConnectionFactory	A configured ConnectionFactory to use on this endpoint.
defaultMep	java.net.URI	
defaultOperation	javax.xml.namespace.QName	
description	org.w3c.dom.Document	
destination	javax.jms.Destination	A configured Destination to use on this endpoint.
destinationStyle	java.lang.String	Specifies the destination type used with the jmsProviderDestinationName. Can be <code>queue</code> or <code>topic</code> .
dynamic	boolean	
endpoint	java.lang.String	The name of the endpoint.
initialContextFactory	java.lang.String	The class name of the JNDI InitialContextFactory to use.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
jmsProviderDestinationName	java.lang.String	The name of the destination created by a call to <code>Session.createQueue</code> or <code>Session.createTopic</code> . This property is used when <code>destination</code> and <code>jndiDestinationName</code> are both <code>null</code> .
jmsProviderReplyToName	java.lang.String	The name of the reply destination created by a call to <code>Session.createQueue</code>

		or
		or <code>Session.createTopic</code> . This property is used when <code>jndiReplyToName</code> is <code>null</code> . A temporary queue will be used if a replyTo is not provided.
jndiConnectionFactoryName	java.lang.String	The name of the JMS ConnectionFactory to lookup in JNDI. Used if <code>connectionFactory</code> is <code>null</code>
jndiDestinationName	java.lang.String	The name of the JMS Destination to lookup in JNDI. Used if <code>destination</code> is <code>null</code> .
jndiProviderURL	java.lang.String	The provider URL used to create the JNDI context.
jndiReplyToName	java.lang.String	The name of the JMS Reply-to destination to lookup in JNDI. If this property is not set a temporary replyTo queue is used.
marshaler	org.apache.servicemix.jms.JmsMarshaler	Specifies the class implementing the logic for marshaling and unmarshaling messages between the JMS destination and the endpoint. Defaults to <code>DefaultJmsMarshaler</code> .
needJavaldentifiers	boolean	Indicates if the JMS properties used by the endpoint need to be spec compliant.
policies	(java.lang.Object)*	
processorName	java.lang.String	Specifies the processor family to use for this endpoint. Can be: <code>multiplexing</code> <code>standard</code> <code>jca</code>
resourceAdapter	javax.resource.spi.ResourceAdapter	The ResourceAdapter to use on a JCA consumer endpoint.
role	java.lang.String	Specifies the role of this endpoint. Endpoints can be <code>consumer</code> or <code>provider</code> .
roleAsString	java.lang.String	
rollbackOnError	boolean	Indicates if the JBI exchange is rolled back if an error is encountered.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
soap	boolean	
soapVersion	java.lang.String	
store	org.apache.servicemix.store.Store	Specifies a persistent data store to hold pending exchanges for the endpoint.
storeFactory	org.apache.servicemix.store.StoreFactory	Specifies the factory used to create presistent data stores for this endpoint.
synchronous	boolean	Indicates if a JCA consumer endpoint sends the JBI exchange synchronously or asynchronously. This changes the transaction boundary.

targetEndpoint	java.lang.String	
targetInterfaceName	javax.xml.namespace.QName	
targetService	javax.xml.namespace.QName	
useMsgldInResponse	boolean	Indicates whether the message id of the request message should be used as the correlation id in the response or the correlation id of the request.
wsdlResource	org.springframework.core.io.Resource	

jms:consumer

Property Name	Туре	Description
cacheLevel	int	Specifies the level of caching all listener. Valid values are 0 throu values map to the following: <u <code="">CACHE_NONE<<code>CACHE_CONNECTION<!--<li-->2 -<code>CACHE_SESSIONCACHE_CONSUMER<!--/</li-->10 The default is10 Code>CACHE_NONE10 code>CACHE_NONE10 code>CACHE_NONE11 code>CACHE_NONE12 code>CACHE_NONE13 code>CACHE_NONE14 code>CACHE_NONE15 code>CACHE_NONE16 code>CACHE>COde>CACHE17 code>CACHE>COde>CACHE18 code>CACHE>COde>CACHE18 code>CACHE>COde>CACHE18 code>CACHE>COde>CACHE18 code>CACHE>COde>CACHE18 code>CACHE>CACHE18 code>CACHE18 code>CACHE>CACHE18 code>CACHE>CACHE18 code>CACHE>CACHE18 code>CACHE>CACHE18 code>CACHE>CACHE18 code>CACHE>CACHE18 code>CACHE>CACHE18 code>CACHE>CACHE18 code>CACHE>CACHE18 code>CACHE</code></code></u>
clientId	java.lang.String	Specifies the JMS client id for a s <code>Connection</code> cre used by this listener.
component	org.apache.servicemix.common.DefaultComponent	
concurrentConsumers	int	Specifies the number of concurr consumers created by the listen property is only used for consur <code>listenerType</code> property to either <code>simple</code> <code>default</code> .
connectionFactory	javax.jms.ConnectionFactory	Specifies the <code>ConnectionFactory</code>
destination	javax.jms.Destination	Specifies the JMS <code>Destination used to receive messages.</code>
destinationChooser	org.apache.servicemix.jms.endpoints.DestinationChooser	Specifies a class implementing lochoosing reply destinations.
destinationName	java.lang.String	Specifies a string identifying the destination used to recieve mess destination is resolved using the <code>DesitinationResolver</code>
destinationResolver	org. spring framework. jms. support. destination. Destination Resolver	Specifies the class implementing converting strings into destination default is <code>DynamicDestinationResort</code>
durableSubscriptionName	java.lang.String	Specifies the name used to regis durable subscription.
endpoint	java.lang.String	The name of the endpoint.
exceptionListener	javax.jms.ExceptionListener	Specifies an <code>ExceptionListener</code>

		in case of a <code>JMSException thrown by the registered message the invocation infrastructure.</code>
idleTaskExecutionLimit	int	Specifies the limit for idle execut receive task, not having received within its execution. If this limit the task will shut down and leave other executing tasks (in case of scheduling; see the "maxConcurrentConsumers" sett each task execution, a number or reception attempts (according to "maxMessagesPerTask" setting) of for an incoming message (accord "receiveTimeout" setting). If all or receive attempts in a given task without a message, the task is considered with respect to received message task may still be rescheduled; however to the specified "idleTaskExecutionLimit", it will see to go down. With this limit being higher consumer will be kept around lown. With this limit being higher consumer will be kept around lowoiding the restart of a consumnew load of messages comes in specify a higher "maxMessagePe or "receiveTimeout" value, which to idle consumers being kept around longer time (while also increasing execution time of each schedule

jms:provider

Property Name	Type	Description
connectionFactory	javax.jms.ConnectionFactory	Specifies the <code>ConnectionFactory the endpoint.</code>
deliveryMode	int	Specifies the JMS delivery mod reply. Defaults to (2)(<code>PERSISTENT</code>
destination	javax.jms.Destination	Specifies the JMS <code>Dest used to send messages.</code>
destinationChooser	org.apache.servicemix.jms.endpoints.DestinationChooser	Specifies a class implementing choosing the destination used messages.
destinationName	java.lang.String	Specifies a string identifying the destination used to send mess destination is resolved using the code Desitination Resolver <
destinationResolver	org.springframework.jms.support.destination.DestinationResolver	Specifies the class implementi converting strings into destina default is <code>DynamicDestinationRe</code>
endpoint	java.lang.String	The name of the endpoint.

		1
explicitQosEnabled	boolean	Specifies if the QoS values spe endpoint are explicitly used w is sent. The default is <code></code>
interfaceName	javax.xml.namespace.QName	The qualified name of the inte by the endpoint.
jms102	boolean	Determines if the provider use compliant APIs.
marshaler	org.apache.servicemix.jms.endpoints.JmsProviderMarshaler	Specifies the class implementi marshaler. The message mars responsible for marshalling an unmarshalling JMS messages. <code>DefaultProviderMarsha</code>
messageldEnabled	boolean	Specifies if your endpoint requessage IDs. Setting the <code>messageIdEnabled to <code>false</code> cause to call its message producer's <code>setDisableMessageID() a value of <code>true</code>broker is then given a hint that need to generate message IDs the messages from the endpoint broker can choose to accept the ignore it.</code></code>
messageTimestampEnabled	boolean	Specifies if your endpoints req stamps on its messages. Settir <code>messageTimeStampEn property to <code>false</code> method with a value <code>true</code>. The JMS given a hint that it does not not message IDs or add them to the from the endpoint. The JMS brochoose to accept the hint or ig</code>
preserveMessageQos	boolean	Specifies whether we want to susing the QoS settings specified message instead in order to promessage QoS. The default is <code>false</code> .
priority	int	Specifies the priority assigned messages. Defaults to 4.
pubSubDomain	boolean	Specifies if the destination is a <code>true</code> means the is a topic. <code>false</code>
pubSubNoLocal	boolean	Specifies if messages publishe listener's <code>Connection < suppressed. The default is <code>false</code>.</code>
receiveTimeout	long	Specifies the timeout for receivin milliseconds.
replyDestination	javax.jms.Destination	Sets the reply destination. This destination will be used as the destination for the response musing an InOut JBI exchange. It the <code>replyDestinationChdoes not return any value.</code>
replyDestinationChooser	org.apache.servicemix.jms.endpoints.DestinationChooser	Specifies a class implementing choosing the destination used replies.

	Sets the name of the reply des
replyDestinationName java.lang.String	property will be used to create <code>replyDestination<code>destinationResolver the endpoint starts if the <code>replyDestinationbeen set.</code></code></code>
service javax.xml.namespace.QName	The qualified name of the serv endpoint exposes.
store org.apache.servicemix.store.Store	Sets the store used to store JBI that are waiting for a response The store will be automatically set.
storeFactory org.apache.servicemix.store.StoreFactory	Sets the store factory used to o store. If none is set, a {@link MemoryStoreFactory} will be cr instead.
timeToLive long	Specifies the number of millise message is valid.

jms:soap-consumer

Туре	Description
int	Specifies the level of caching allelistener. Valid values are 0 throuvalues map to the following: <u <code="">CACHE_NONE<<code>CACHE_CONNECTION<!--</li-->2 -<code>CACHE_SESSION</code><code>CACHE_CONSUMER</code> The default is <code>CACHE_NONE</code><code>IistenerType</code> property only effects consumers<code>de>default</code><code>.</code></code></u>
java.lang.String	Specifies the JMS client id for a s <code>Connection</code> cre used by this listener.
org.apache.servicemix.common.DefaultComponent	
int	Specifies the number of concurred consumers created by the listend property is only used for consume code>listenerType property to either <code>simple</code> <code>default</code> .
javax.jms.ConnectionFactory	Specifies the <code>ConnectionFactory</code>
javax.jms.Destination	Specifies the JMS <code>Destination used to receive messages.</code>
org.apache.servicemix.jms.endpoints.DestinationChooser	Specifies a class implementing le choosing reply destinations.
java.lang.String	Specifies a string identifying the destination used to recieve mess destination is resolved using the <code>DesitinationResolver</code>
	int java.lang.String org.apache.servicemix.common.DefaultComponent int javax.jms.ConnectionFactory javax.jms.Destination org.apache.servicemix.jms.endpoints.DestinationChooser

destinationResolver	org. spring framework. jms. support. destination. Destination Resolver	Specifies the class implementing converting strings into destination default is <code>DynamicDestinationResort</code>
durableSubscriptionName	java.lang.String	Specifies the name used to regis durable subscription.
endpoint	java.lang.String	The name of the endpoint.
exceptionListener	javax.jms.ExceptionListener	Specifies an <code>ExceptionListener</code> JMSException thrown by the registered message the invocation infrastructure.
idleTaskExecutionLimit	int	Specifies the limit for idle executive receive task, not having received within its execution. If this limit the task will shut down and leave other executing tasks (in case of scheduling; see the "maxConcurrentConsumers" sette each task execution, a number of reception attempts (according to "maxMessagesPerTask" setting) of for an incoming message (accord "receiveTimeout" setting). If all of receive attempts in a given task without a message, the task is with respect to received message task may still be rescheduled; however the treached the specified "idleTaskExecutionLimit", it will scase of dynamic scaling). Raise the you encounter too frequent scaling down. With this limit being high consumer will be kept around lo avoiding the restart of a consumnew load of messages comes in specify a higher "maxMessagePeror "receiveTimeout" value, which to idle consumers being kept are longer time (while also increasing execution time of each schedule).

jms:soap-provider

Property Name	Type	Description
connectionFactory	javax.jms.ConnectionFactory	Specifies the <code>ConnectionFactory</code>
deliveryMode	int	Specifies the JMS delivery mod reply. Defaults to (2)(<code>PERSISTENT</code>
destination	javax.jms.Destination	Specifies the JMS <code>Dest</code>
destinationChooser	org.apache.servicemix.jms.endpoints.DestinationChooser	Specifies a class implementing choosing the destination used messages.
destinationName	java.lang.String	Specifies a string identifying the destination used to send mess

		destination is resolved using t <code>DesitinationResolver<</code>
destinationResolver	org. spring framework. jms. support. destination. Destination Resolver	Specifies the class implementi converting strings into destina default is <code>DynamicDestinationRe</code>
endpoint	java.lang.String	The name of the endpoint.
explicitQosEnabled	boolean	Specifies if the QoS values spe endpoint are explicitly used w is sent. The default is <code></code>
interfaceName	javax.xml.namespace.QName	The qualified name of the inte by the endpoint.
jms102	boolean	Determines if the provider use compliant APIs.
marshaler	org.apache.servicemix.jms.endpoints.JmsProviderMarshaler	Specifies the class implementi marshaler. The message mars responsible for marshalling an unmarshalling JMS messages. <code>DefaultProviderMarsha</code>
messageldEnabled	boolean	Specifies if your endpoint requests age IDs. Setting the <code>messageIdEnabled</code> to <code>false</code> cause to call its message producer's <code>setDisableMessageID() a value of <code>true</code> broker is then given a hint than need to generate message IDs the messages from the endpoint broker can choose to accept the ignore it.</code>
messageTimestampEnabled	boolean	Specifies if your endpoints req stamps on its messages. Settir <code>messageTimeStampEn property to <code>false</code>setDisableMessageTim </code> method with a value <code>true</code> . The JMS given a hint that it does not not message IDs or add them to the from the endpoint. The JMS brochoose to accept the hint or ig
policies	(org.apache.servicemix.soap.api.Policy)*	Specifies an array of interceptor process SOAP messages.
preserveMessageQos	boolean	Specifies whether we want to susing the QoS settings specific message instead in order to promessage QoS. The default is <code>false</code> .
priority	int	Specifies the priority assigned messages. Defaults to 4.
pubSubDomain	boolean	Specifies if the destination is a <code>true</code> means the is a topic. <code>false</code>
pubSubNoLocal	boolean	Specifies if messages publisher listener's <code>Connection < suppressed. The default is <code>false</code>.</code>

receiveTimeout	long	Specifies the timeout for recein milliseconds.
replyDestination	javax.jms.Destination	Sets the reply destination. This destination will be used as the destination for the response musing an InOut JBI exchange. If the <code>replyDestinationCl does not return any value.</code>
replyDestinationChooser	org.apache.servicemix.jms.endpoints.DestinationChooser	Specifies a class implementing choosing the destination used replies.
replyDestinationName	java.lang.String	Sets the name of the reply desproperty will be used to create <code>replyDestination</code> destinationResolver the endpoint starts if the <code>replyDestination</code>
service	javax.xml.namespace.QName	The qualified name of the servendpoint exposes.
store	org.apache.servicemix.store.Store	Sets the store used to store JB that are waiting for a response The store will be automatically set.
storeFactory	org.apache.servicemix.store.StoreFactory	Sets the store factory used to store. If none is set, a {@link MemoryStoreFactory} will be cinstead.
timeToLive	long	Specifies the number of millise message is valid.
useJbiWrapper	boolean	Specifies if the endpoint expect messages to be wrapped in the Defaults to <code>true</code>
validateWsdl	boolean	Specifies if the WSDL is checked compliance. Defaults to <code< td=""></code<>
wsdl	org.springframework.core.io.Resource	Specifies the WSDL document service's interface.

jms:jca-consumer

Property Name	Туре	Description
activationSpec	javax.resource.spi.ActivationSpec	Specifies the activation informati by the endpoint.
bootstrapContext	iavay resource sni RootstranContext	Specifies the <code>BootStrapContextstart the resource adapter. If this not set, a default <code>BootstrpContext</code> created.</code>
connectionFactory	javax.jms.ConnectionFactory	Specifies the <code>ConnectionFactory</code>
destinationChooser	org.apache.servicemix.jms.endpoints.DestinationChooser	Specifies a class implementing lo choosing reply destinations.
destinationResolver	org.springframework.jms.support.destination.DestinationResolver	Specifies the class implementing converting strings into destination

java.lang.String	default is <code>DynamicDestinationReso</code>
java.lang.String	The name of the andraint
	The name of the endpoint.
javax.xml.namespace.QName	The qualified name of the interfaby the endpoint.
boolean	Specifies if the consumer uses JN compliant APIs. Defaults to <code>false</code> .
org.apache.servicemix.jms.endpoints.JmsConsumerMarshaler	Specifies the class implementing marshaler. The message marsha responsible for marshalling and unmarshalling JMS messages. Th <code>DefaultConsumerMarsha</code>
boolean	Specifies if the destination is a to <code>true</code> means the is a topic. <code>false</code> destination is a queue.
int	Specifies the JMS delivery mode reply. Defaults to 2(<code>PERSISTENT</code>).
javax.jms.Destination	Specifies the JMS <code>Destination for the replies. If this value is not endpoint will use the <code>destinationChooserreplyDestinationN property to determine the desiting</code></code>
java.lang.String	Specifies the name of the JMS de use for the reply. The actual JMS is resolved using the <code>DestinationResolver.destinationResolver</code>
boolean	Specifies if the QoS values specified endpoint are explicitly used when sent. The default is <code>false</code>
int	Specifies the JMS message priorit reply. Defaults to 4.
java.util.Map	Specifies custom properties to be the reply's JMS header.
long	Specifies the number of milliseco message is valid. The default is u
javax.resource.spi.ResourceAdapter	Specifies the resource adapter us endpoint.
javax.xml.namespace.QName	The qualified name of the service endpoint exposes.
boolean	Specifies if the consumer retains information about the message ϵ while it is in process.
org.apache.servicemix.store.Store	Specifies the persistent store use exchanges that are waiting to be The store will be automatically c set and the endpoint's <code>stateless</code> prope <code>false</code> .
org.apache.servicemix.store.StoreFactory	Specifies the store factory used t store. If none is set and the endp <code>stateless</code> prope <code>false</code> , a {@link
	org.apache.servicemix.jms.endpoints.JmsConsumerMarshaler boolean int javax.jms.Destination java.lang.String boolean int java.util.Map long javax.resource.spi.ResourceAdapter javax.xml.namespace.QName boolean org.apache.servicemix.store.Store

		MemoryStoreFactory} will be creatinstead.
synchronous	boolean	Specifies if the consumer will blo waiting for a response. This mea consumer can only process one r time. Defaults to <code>true</code>
targetEndpoint	java.lang.String	the name of the endpoint to which are sent
targetInterface	javax.xml.namespace.QName	the QName of the interface to whare sent
targetOperation	javax.xml.namespace.QName	the QName of the operation to w requests are sent
targetService	javax.xml.namespace.QName	the QName of the service to which are sent
targetUri	java.lang.String	Set the target service/endpoint/i using a URI.
useMessageldInResponse	java.lang.Boolean	Specifies if the request message' as the reply's correlation ID. The behavior is to use the request's c Setting this to <code>true</code>

2.12. servicemix-mail

Overview

he ServiceMix Mail component provides support for receiving and sending mails via the enterprise service bus.

Namespace and xbean.xml

The namespace URI for the servicemix-bean JBI component is http://servicemix.apache.org/mail/1.0. This is an example of an xbean.xml file with a namespace definition with prefix bean.

```
<beans xmlns:mail="http://servicemix.apache.org/mail/1.0">
  <!-- add mail:poller and mail:sender definitions here -->
```

Endpoint types

The servicemix-mail component defines two endpoint type:

- mail:poller:: Connect to a POP3 or IMAP server and send a MessageExchange for every mail
- mail:sender:: Connect to an SMTP server and send a mail for every JBI MessageExchange it receives

mail:poller

Property Name	Туре	
concurrentPolling	boolean	Sets whether more than one poll c value is <code>false</code> .
connection	java.lang.String	<pre>Specifies the connection URI u</pre>
customProperties	java.util.Map	<pre>Specifies a <code>java.util.Maproperties for the connection. POP3 headers:</code></pre> <pre>/> i> value: "true" null</pre> <pre>/b < br/> </pre>
customTrustManagers	java.lang.String	Specifies one or more trust m (;). These classes <code>Trustmanager</code> int constructor to be valid.
debugMode	boolean	Specifies if the JavaMail is run that while connecting to server and debug output. br /> This mode is with your mail server connection a communication with the server. mode is enabled is disabled cb>false br/>
delay	long	Sets the amount of time in millised making the first poll.
deleteProcessedMessages	boolean	This flag is used to indicate w mail folder. If it is set to <code>tr sent into the bus successfully. If so inside the mail folder but will be n the mail results in an error, the mail on next run of the polling cycle. false</code>
endpoint	java.lang.String	The name of the endpoint.
firstTime	java.util.Date	Sets the date on which the first po <code>setDelay</code> , the dela

interfaceName	javax.xml.namespace.QName	The qualified name of the interfac
marshaler	org.apache.servicemix.mail.marshaler.AbstractMailMarshaler	for converting a mail into a normal abstract class <p< td=""></p<>
maxFetchSize	int	This sets the maximum amout the maximum amount is reached skipped. <i> nbsp; he defau (unlimited)</i>
period	long	Sets the number of milliseconds b
processOnlyUnseenMessages	boolean	This flag is used to indicate wonly the unseen mails are process <code>true</code> or it is set to <i>nbsp; he default value is b></i>
scheduler	org.apache.servicemix.common.scheduler.Scheduler	Set a custom Scheduler implemen the polling schedule.
service	javax.xml.namespace.QName	The qualified name of the service
storage	org.apache.servicemix.store.Store	Specifies a <code>org.apach will be used for storing the identif This store is only used with tl processed only. <ip>null> <br< td=""></br<></ip></code>
targetEndpoint	java.lang.String	the name of the endpoint to which
targetInterface	javax.xml.namespace.QName	the QName of the interface to whi
targetOperation	javax.xml.namespace.QName	the QName of the operation to wh
targetService	javax.xml.namespace.QName	the QName of the service to which
targetUri	java.lang.String	Set the target service/endpoint/in

mail:sender

Property Name	Туре	De
connection	java.lang.String	Specifies the connection URI used <u>Templates:</u> nbsp; i> <rotocol>//<ser></ser> /> nbsp; nbsp; nbsp; OR /> nbsp; nbsp; nbsp; OR /> nbsp; i><rotocol>//<ost>:<ort>/<ott> cort>/<ost>:<ort>/<ott> cbr /> cellpadding="0" cellspacing="0"> <tr: align="left"> cellspacing="0"> cellspacing="0"> <tr: align="left"> cellspacing="0"> cellspacing="0" cu> Name // cu> ctd>>td> cu> Cu // cu> ctd>>td> cu> cu> cu> cu> cu> cu> cu> cu> cu> cu</tr:></tr:></ott></ort></ost></ott></ort></ost></rotocol></rotocol>
customProperties	java.util.Map	Specifies a <code>java.util.Map <pre>properties for the connection. POP3 headers: /> i>value: "true" null /> i> /> code>initial connection in the connecti</pre></code>

customTrustManagers	java.lang.String	Specifies one or more trust manage (;). These classes have <code>Trustmanager</code> interfaconstructor to be valid. br/> without a check you may consider using class. It is actually only an empty stubbe aware that this will be a security ris <i>nbsp; he default value is null-</i>
debugMode	boolean	Specifies if the JavaMail is run in that while connecting to server and prodebug output. This mode is ve with your mail server connection and y communication with the server. mode is enabled is disabled is <b <="" b="" false=""> is connection and y communication with the server. is <b <="" b="" enabled=""> is <b <="" b="" enabled=""> is <b <="" b="" false=""> is connection and y communication with the server. is connection and y connection and y
endpoint	java.lang.String	The name of the endpoint.
ignoreMessageProperties	(java.lang.Object)*	Specifies a <code>java.util.List properties to skip. addresses from the normalized messae "org.apache.servicemix.mail.to" "org.apache.servicemix.mail.cc" "org.apache.servicemix.mail.bcc" "org.apache.servicemix.mail.from" "org.apache.servicemix.mail.from" "org.apache.servicemix.mail.replyto" is null <br <="" td=""/></code>
interfaceName	javax.xml.namespace.QName	The qualified name of the interface ex
marshaler	org.apache.servicemix.mail.marshaler.AbstractMailMarshaler	With this method you can specify for converting a normalized message i abstract class <code>AbstractMailMar don't specify a marshaler, the <code> used.</code></code>
receiver	java.lang.String	Specifies the receiver address(es) <i>nbsp; he default value is null-</i>
sender	java.lang.String	Specifies the sender address of th <i> nbsp; he default value is no-r</i>
service	javax.xml.namespace.QName	The qualified name of the service the e

2.13. servicemix-osworkflow

Overview

The ServiceMix OSWorkflow component provides workflow functionality to the ESB. You can specify one or more workflows and it's processing will start when a valid message is received.

Namespace and xbean.xml

The namespace URI for the servicemix-bean JBI component is http://servicemix.apache.org/osworkflow/1.0. This is an example of an xbean.xml file with a namespace definition with prefix bean.

```
<beans xmlns:osworkflow="http://servicemix.apache.org/osworkflow/1.0">
    <!-- add osworkflow:endpoint here -->
</beans>
```

Endpoint types

The servicemix-osworkflow component defines a single endpoint type:

• osworkflow:endpoint :: The endpoint will receive messages from the NMR and will then start the processing of the workflow.

osworkflow:endpoint

Endpoint properties

Property Name	Туре	Description
action	int	The initial action to trigger in the workflow.
caller	java.lang.String	The caller user name to be used when executing the workflow.
endpoint	java.lang.String	The name of the endpoint.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
workflowName	java.lang.String	The name of the workflow to be used for handling the exchange.

2.14. servicemix-quartz

Overview

The servicemix-quartz component is a standard JBI Service Engine able to schedule and trigger jobs using the great Quartz scheduler.

Namespace and xbean.xml

The namespace URI for the servicemix-bean JBI component is http://servicemix.apache.org/quartz/1.0. This is an example of an xbean.xml file with a namespace definition with prefix bean.

```
<beans xmlns:osworkflow="http://servicemix.apache.org/quartz/1.0">
  <!-- add quartz:endpoint here -->
</beans>
```

Endpoint types

The servicemix-quartz component defines a single endpoint type:

 quartz:endpoint :: The quartz endpoint can be used to fire message exchanges at a given (recurrent) time.

quartz:endpoint

Endpoint properties

Property Name	Туре	Description
calendars	java.util.Map	A map with {@link org.quartz.Calendar} instances to define the trigger schedule.
endpoint	java.lang.String	The name of the endpoint.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
jobDetail	org.quartz.JobDetail	Set a custom JobDetail bean to be used in the triggered events.
marshaler	org.apache.servicemix.quartz.support.QuartzMarshaler	Set a custom marshaler class to translate the JobDetail information into a normalized message.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
targetEndpoint	java.lang.String	the name of the endpoint to which requests are sent
targetInterface	javax.xml.namespace.QName	the QName of the interface to which requests are sent
targetOperation	javax.xml.namespace.QName	the QName of the operation to which requests are sent
targetService	javax.xml.namespace.QName	the QName of the service to which requests are sent
targetUri	java.lang.String	Set the target service/endpoint/interface using a URI.
trigger	<u>org.quartz.Trigger</u>	A single {@link org.quartz.Trigger} instance to define the trigger schedule.
triggers	(java.lang.Object)*	A list of of {@link org.quartz.Trigger} instances to allow configuring multiple schedules for the same endpoint.

2.15. servicemix-saxon

Overview

The servicemix-saxon component is a standard JBI Service Engine for XSLT / XQuery. This component is based on Saxon and supports XSLT 2.0 and XPath 2.0, and XQuery 1.0.

Namespace and xbean.xml

The namespace URI for the servicemix-bean JBI component is http://servicemix.apache.org/saxon/1.0. This is an example of xbean.xml file with a namespace definition with prefix saxon.

```
<beans xmlns:saxon="http://servicemix.apache.org/saxon /1.0">
  <!-- add saxon:xslt, saxon:xquery or saxon:proxy definitions here -->
  </beans>
```

Endpoint types

The servicemix-saxon component defines these endpoints:

- saxon:xslt: Translates the in message content using XSLT to send back the translated
 content in the out message
- saxon:proxy: Acts as a proxy for an endpoint, translating the message passed to/from the endpoint using XSLT
- saxon:xquery: Use xquery to extract parts of the XML

Endpoint saxon:xslt

The XSLT endpoint can be used to apply an XSLT stylesheet to the incoming exchange and will return the transformed result as the output message.

```
<saxon:xslt service="test:xslt" endpoint="endpoint"
    resource="classpath:transform.xsl" />
```

Property Name	Туре	Description
configuration	net.sf.saxon.Configuration	Additional configuration for the Saxon XSL-T/XQuery processor.
copyAttachments	boolean	Copy attachments into the resulting normalized message. Defaults to <code>true</code> .
copyProperties	boolean	Copy properties into the resulting normalized message. Defaults to <code>true</code> .
copySubject	boolean	Copy the security subject into the resulting normalized message. Defaults to <code>true</code> .
endpoint	java.lang.String	The name of the endpoint.
expression	org.apache.servicemix.expression.Expression	Expression to dynamically determine the stylesheet to use for processing the exchange.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
parameters	java.util.Map	Add parameter names and values that are available during XSL/XQuery processing.
reload	boolean	Sets whether the endpoint should reload the resource each time it is used. A value of <code>true</code> will ensure that the resource is not cached which can be useful if the resource is updated regularly and is stored outside of the service unit.

resource	org.springframework.core.io.Resource	Spring Resource for the XSL-T stylesheet or XQuery file to use.
result	java.lang.String	The output result type, possible values are dom, bytes, string. Defaults to dom.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
sourceTransformer	org.apache.servicemix.jbi.jaxp.SourceTransformer	Set a SourceTransformer instance to use for handling XML conversions.
transformerFactory	javax.xml.transform.TransformerFactory	Set a transform factory, e.g. for injecting a custom transformer configuration or implementation.
useDomSourceForContent	java.lang.Boolean	Convert the message body Source into a DOMSource. Defaults to <code>false.</code>
useDomSourceForXslt	boolean	Convert the XSL-T stylesheet Source into a DOMSource. Defaults to <code>true.</code>
wsdlResource	org.springframework.core.io.Resource	Resource referring to the WSDL resource that defines this endpoint.

Mandatory properties

The endpoint requires one of these two properties to be specified:

Attribute	Туре	description
resource	(Spring resource)	the spring resource pointing to the XSLT stylesheet
expression	(ServiceMix expression)	expression used to dynamically load the stylesheet

Optional properties

Attribute	Туре	description
wsdlResource	(Spring resource)	if set, the wsdl will be retrieved from the given Spring resource
transformerFactory	(TransformerFactory, defaults to the Saxon implementation)	TraX factory to create transformers
configuration	(Saxon configuration)	Saxon configuration object
result	(String, defaults to dom)	Allows specifying the output result type, possible values are dom, bytes, string
copyAttachments, copyProperties and copySubject	(default to true	Configure to copy message attachments, properties and security subject over to the result message
useDomSourceForXslt	(defaults to true	when set to true, forces the transformation of the xslt stylesheet into a DOM document before giving it to the transformer
useDomSourceForContent	(defaults to false)	when set to true, forces the transformation of the incoming JBI message into a DOM document before giving it to the transformer

parameters a Map	containing additional parameters to give to the transformation engine
-------------------------	---

Using properties and parameters

All properties defined on the JBI exchange and input JBI message will be available for use inside the XSLT stylesheet as parameters.

In addition to those properties and the one specified in the parameters property on the endpoint, the following objects are also available:

- exchange : the JBI exchange
- in: the input JBI NormalizedMessage
- component : the XsltEndpoint instance being called

Below is an example that demonstrates how the properties of the exchange and normalized message can be accessed from inside the xslt.

All those parameters can be accessed using XSLT standard ways using <xsl:param/>.

Endpoint saxon:proxy

One common use case is the need to transform a request coming from a service and send it to another service and do the same with the response. A simple example is the need to translate the request and responses between two SOAP endpoints. Such a use case could be implemented using two XSLT endpoints and an EIP StaticRoutingSlip. However, there are some drawbacks, as the operation is lost in the process, and a static routing slip can not be used to process InOnly exchanges.

	useDomSourceForXslt	boolean	Convert the XSL-T stylesheet Sources into a Defaults to <code>true.</code>
	wsdlResource	org.springframework.core.io.Resource	Resource referring to the WSDL resource that endpoint.

Mandatory properties

Depending on the MEP, you have to set one or more XSL stylesheets to be used for converting the message payloads:

Attribute	Туре	Description	
resource	Spring resource	the XSLT stylesheet used to transform the input message	
outResource	Spring resource	the XSLT stylesheet used to transform the output message	
faultResource	Spring resource	the XSLT stylesheet used to transform the fault message	
expression	ServiceMix expression	used to dynamically load the stylesheet. If set, it will prevail against all resource, outResource and faultResource attributes	

You also have to specify the target service that should be invoked from this endpoint:

• target: ExchangeTarget that specifies the target service for the proxy endpoint

Optional properties

Attribute	Туре	Description
wsdlResource	Spring resource	if set, the wsdl will be retrieved from the given (<u>Spring resource</u>)
transformerFactory (defaults to the Saxon implementation) :: TraX TransformerFactory to create transformers	configuration	(Saxon configuration)
result	(defaults to dom) :: Allows specifying the output result type, possible values are dom, bytes, string	copyAttachments, copyProperties and copySubject

Endpoint saxon:xquery

The XQuery endpoint can be used to apply a selected XQuery to the input document.

```
<saxon:xquery service="test:xquery" endpoint="endpoint"
    resource="classpath:query.xq" />
```

Property Name	Туре	Description
configuration	net.sf.saxon.Configuration	Additional configuration for the Saxon XSL-T/XQuery processor.
copyAttachments	boolean	Copy attachments into the resulting normalized message. Defaults to <code>true</code> .
copyProperties	boolean	Copy properties into the resulting normalized message. Defaults to <code>true</code> .

copySubject	boolean	Copy the security subject into the resulting normalized message. Defaults to <code>true</code> .
endpoint	java.lang.String	The name of the endpoint.
expression	org.apache.servicemix.expression.Expression	Expression to dynamically determine the stylesheet to use for processing the exchange.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
outputProperties	java.util.Properties	Configure serialization properties, in JAXP format, if the result is to be serialized. This parameter can be defaulted to null.
parameters	java.util.Map	Add parameter names and values that are available during XSL/XQuery processing.
query	java.lang.String	Configure the XQuery expression to evaluate.
reload	boolean	Sets whether the endpoint should reload the resource each time it is used. A value of <code>true</code> will ensure that the resource is not cached which can be useful if the resource is updated regularly and is stored outside of the service unit.
resource	org.springframework.core.io.Resource	Spring Resource for the XSL-T stylesheet or XQuery file to use.
result	java.lang.String	The output result type, possible values are dom, bytes, string. Defaults to dom.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
sourceTransformer	org.apache.servicemix.jbi.jaxp.SourceTransformer	Set a SourceTransformer instance to use for handling XML conversions.
wsdlResource	org.springframework.core.io.Resource	Resource referring to the WSDL resource that defines this endpoint.

Mandatory properties

You need to specify one of query, resource or expression

Attribute	Type	Description
query	String	containing the inlined XQuery expression
resource	Spring resource	resource pointing to the XQuery
expression	ServiceMix expression	expression to dynamically load the xquery

Optional properties

Attribute	Type	Description
wsdlResource	(<u>Spring</u> resource)	WSDL describing the endpoint
outputProperties	Мар	Saxon specific output properties
configuration	(<u>Saxon</u> configuration)	Saxon configuration object

result	(defaults to dom)	Allows specifying the output result type, possible values are dom, bytes, string
copyAttachments, copyProperties and copySubject	(default to true)	Configure to copy message attachments, properties and security subject over to the result message

Sample configurations

Dynamic stylesheet selection (saxon:xslt)

This endpoint configuration will dynamically load the XSL-T resource that is specified in the xslt.source property on the NormalizedMessage

Using parameters in the XSL-T stylesheet (saxon:xslt)

You can define a Map of parameters on the saxon:xslt endpoint.

In the XSL file, you can access the parameter values with <xsl:param/>. You can also access headers on the NormalizedMessage (like e.g. org.apache.servicemix.file) with the same syntax.

Inlined XQuery and specific output configuration (saxon:xquery)

Dynamic XQuery selection (saxon:xquery)

This endpoint configuration will dynamically load the XQuery resource that is specified in the xquery.source property on the NormalizedMessage

2.16. servicemix-scripting

Overview

The ServiceMix Scripting component provides support for processing scripts using JSR-223 compliant scripting languages.

The component is currently shipping with:

- Groovy (1.5.6)
- JRuby (1.1.2)
- Rhino JavaScript (1.7R1)

Namespace and xbean.xml

The namespace URI for the servicemix-bean JBI component is http://servicemix.apache.org/scripting/1.0. This is an example of an xbean.xml file with a namespace definition with prefix bean.

```
<beans xmlns:scripting="http://servicemix.apache.org/scripting/1.0">
  <!-- add scripting:endpoint here -->
  </beans>
```

Endpoint types

The servicemix-scripting component defines a single endpoint type:

• scripting:endpoint :: The scripting endpoint can be used to use scripts to handle exchanges or send new exchanges

scripting:endpoint

Property Name	Туре	Description
bindings	java.util.Map	A Map with additional variables that are made available during script execution.
copyAttachments	boolean	Copy the attachments into the 'out' message. Defaults to <code>true</code> .
copyProperties	boolean	Copy the properties into the 'out' message. Defaults to <code>true</code> .
disableOutput	boolean	Set this flag to true to <code>true</code> to avoid sending back a response message. Defaults to <code>false</code>
endpoint	java.lang.String	The name of the endpoint.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
language	java.lang.String	The scripting language to be used. Defaults to <code>autodetect</code> to determine the language by the script file extension.
logResourceBundle	java.lang.String	The resource bundle to use when logging internationalized messages.
marshaler	org.apache.servicemix.scripting.ScriptingMarshalerSupport	Custom marshaler implementation to handle startup/shutdown, loading the script code and registering additional user beans.
script	org.springframework.core.io.Resource	Spring Resource referring to the script location.
scriptLogger	java.util.logging.Logger	returns the script logger
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
targetEndpoint	java.lang.String	Target endpoint for the output exchange that is created by the script.
targetInterface	javax.xml.namespace.QName	Target interface for the output exchange that is created by the script.

targetOperation	javax.xml.namespace.QName	Target operation for the output exchange that is created by the script.
targetService	javax.xml.namespace.QName	Target service for the output exchange that is created by the script.
targetUri	java.lang.String	URI for configuring target service/endpoint/interface for the exchange that is created by the script.

2.17. servicemix-snmp

Overview

The ServiceMix SNMP component provides support for receiving SNMP events via the enterprise service bus by using the SNMP4J library.

Namespace and xbean.xml

The namespace URI for the servicemix-bean JBI component is http://servicemix.apache.org/snmp/1.0. This is an example of an xbean.xml file with a namespace definition with prefix bean.

```
<beans xmlns:snmp="http://servicemix.apache.org/snmp/1.0">
  <!-- add snmp:poller or snmp:sender definitions here -->
</beans>
```

Endpoint types

The servicemix-snmp component defines two endpoint types:

- snmp:poller:: Periodically polls a device status using SNMP and sends the OIDs as a JBI MessageExchange
- snmp:trap-consumer:: Consumes an SNMP trap message and sends the OIDs as a JBI MessageExchange

snmp:poller

Property Name	2	Туре	Description
address	java.lang.String		Specifies the connection URI used to conton to a snmp capable device. <u>Template:</u><bb> nbsp; i><rotocol><ost><ort>/i> <u>Details:</u><bb> border="0" cellpadding="0" cellspacing="0" <u>Details:</u></bb></ort></ost></rotocol></bb>

		>to use (udp or tcp) +td> to protect to use (udp or tcp) >td> >td>host +td> the name or ip address the snmp capable device >tr> >td>port +td> +td> the port number to use >td> +td> +td> +td> +td> +td> +td> +t
concurrentPolling	boolean	Sets whether more than one poll can be actitime (true means yes). Default value is <code>false</code> .
delay	long	Sets the amount of time in milliseconds that endpoint should wait before making the firs
endpoint	java.lang.String	The name of the endpoint.
firstTime	java.util.Date	Sets the date on which the first poll will be executed. If a delay is also set using <code>setDelay</code> , the delay interva added after the date specified.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed endpoint.
marshaler	org.apache.servicemix.snmp.marshaler.SnmpMarshalerSupport	Specifies a marshaler class which provided for converting a snmp response into a normalized message. This class has to imple the <code>SnmpMarshalerSupport</code> interface. If you don't specify a marshaler, t <code>DefaultSnmpMarshaler /code> will used.</code>
oids	(java.lang.Object)*	Specifies a reference to a list of OID val which will be used for the snmp request. Yo two possibilities how to specify the value: /> '> i> a) referencing to a file contain list of OID values separated by a line feed
period	long	Sets the number of milliseconds between poattempts.
retries	int	Specifies the connection retries. <i> nbsp; he default value is 2</i>
scheduler	org.apache.servicemix.common.scheduler.Scheduler	Set a custom Scheduler implementation if you need more fine-grained control over the poschedule.
service	javax.xml.namespace.QName	The qualified name of the service the endpo
snmpCommunity	java.lang.String	Specifies the snmp community to use. < <i>nbsp; he default value is "public"</i>
snmpVersion	int	Specifies the snmp protocol version to use. <i> nbsp; he default value is <b: (version="" 1)<="" b=""></b:></i> /i> /b>

targetEndpoint	java.lang.String	the name of the endpoint to which requests sent
targetInterface	javax.xml.namespace.QName	the QName of the interface to which reques sent
targetOperation	javax.xml.namespace.QName	the QName of the operation to which requesent
targetService	javax.xml.namespace.QName	the QName of the service to which requests sent
targetUri	java.lang.String	Set the target service/endpoint/interface us URI.
timeout	int	Specifies the connection time out in milliseconds. <i> nbsp; he default val <br <="" td=""/></i>

vfs:trap-consumer

Endpoint properties

2.18. servicemix-validation

Overview

The ServiceMix Validation component provides schema validation of documents using JAXP 1.3 and XMLSchema or RelaxNG.

Namespace and xbean.xml

The namespace URI for the servicemix-bean JBI component is http://servicemix.apache.org/validation/1.0. This is an example of an xbean.xml file with a namespace definition with prefix bean.

```
<beans xmlns:scripting="http://servicemix.apache.org/validation/1.0">
  <!-- add validation:endpoint here -->
</beans>
```

Endpoint types

The servicemix-validation component defines a single endpoint type:

• validation:endpoint :: Validates the incoming XML message – can be configured to fail the exchange or to send validation errors back to the sender in the message body.

validation:endpoint

Property Name		Туре	
endpoint	java.lang.String		The name of the

errorHandlerFactory	org.apache.servicemix.validation.handler.MessageAwareErrorHandlerFactory	Set a custom errors. validation errors. <code>Counting</code>
handlingErrorMethod	java.lang.String	Configure how va handled. Default <code>FAULT_JB <dt><code>FAU jbi exception is the (depending on us <dt><code>FAU <dd>The validating fault message (de </dd></code></dt></code></dt></code>
interfaceName	javax.xml.namespace.QName	The qualified nan by the endpoint.
noNamespaceSchemaResource	org.springframework.core.io.Resource	Set the validation namespace is spe
schema	javax.xml.validation.Schema	Set the validation
schemaLanguage	java.lang.String	Set the validation to <code>http:// XMLSchema</code>
schemaResource	org.springframework.core.io.Resource	Set the validation Resource.
schemaSource	javax.xml.transform.Source	Set the validation
service	javax.xml.namespace.QName	The qualified nan exposes.

2.19. servicemix-vfs

Overview

The ServiceMix VFS component provides support for reading from and writing to virtual file systems via the enterprise service bus by using the Apache commons-vfs library.

Namespace and xbean.xml

The namespace URI for the servicemix-bean JBI component is http://servicemix.apache.org/vfs/1.0. This is an example of an xbean.xml file with a namespace definition with prefix bean.

```
<beans xmlns:vfs="http://servicemix.apache.org/vfs/1.0">
  <!-- add vfs:poller or vfs:sender here -->
</beans>
```

Endpoint types

The servicemix-vfs component defines two endpoint types:

- vfs:poller:: Periodically polls a directory on one of the VFS-supported file systems for files and sends an exchange for every file
- vfs:sender:: Writes the contents of an exchange to a file on one of the VFS-supported file systems

Description

Type

vfs:poller

Property Name

comparator	java.util.Comparator	Specifies a <code>Comparator</code> object.
component	org.apache.servicemix.common.DefaultComponent	the default component
concurrentExchange	boolean	
concurrentPolling	boolean	Sets whether more than one poll can be active at a Default value is <code>false</code> .
delay	long	Sets the amount of time in milliseconds that the ermaking the first poll.
deleteFile	boolean	Specifies if files should be deleted after they are pre- <code>true</code> .
endpoint	java.lang.String	The name of the endpoint.
fileSystemManager	org.apache.commons.vfs.FileSystemManager	sets the file system manager
firstTime	java.util.Date	Sets the date on which the first poll will be execute <code>setDelay</code> , the delay interval will be specified.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the
lockManager	org.apache.servicemix.common.locks.LockManager	Bean defining the class implementing the file locki be an implementation of the <code>org.apache.servicemix.locks.LockManager- this will be set to an instances of <code>org.apache.servicemix.common.locks.impl</code></code>
marshaler	org.apache.servicemix.components.util.FileMarshaler	Specifies a <code>FileMarshaler</code> object the NMR. The default file marshaller can read valid <code>FileMarshaler</code> objects are impleme <code>org.apache.servicemix.components.util.File</code>
path	java.lang.String	Specifies a String object representing the path of Examples: • file:///home/lhein/pollFolder • zip:file:///home/lhein/pollFolder/myFile • jar:http://www.myhost.com/files/Exampl • jar:/lib/classes.jar!/META-INF/manifest • tar:gz:http://anyhost/dir/mytar.tar.gz!/n README.txt • tgz:file://anyhost/dir/mytar.tgz!/somepa • gz:/my/gz/file.gz • http://myusername@somehost/index.htm • webdav://somehost:8080/dist • ftp://myusername:mypassword@someho somefile.tgz • sftp://myusername:mypassword@someho somefile.tgz • smb://somehost/home • tmp://dir/somefile.txt • res:path/in/classpath/image.png • ram:///any/path/to/file.txt • mime:file:///your/path/mail/anymail.min

vfs:sender

Endpoint properties

Property Name	Туре	Description
endpoint	java.lang.String	The name of the endpoint.
fileSystemManager	org.apache.commons.vfs.FileSystemManager	sets the file system manager
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the
marshaler	org.apache.servicemix.components.util.FileMarshaler	Specifies a <code>FileMarshaler</code> object that data into the NMR. The default file marshaller can re <code>FileMarshaler</code> objects are implement <code>org.apache.servicemix.components.util.FileMarshaler</code>
path	java.lang.String	Specifies a String object representing the path of the polled. Examples: • file:///home/lhein/pollFolder • zip:file:///home/lhein/pollFolder/myFile.z • jar:http://www.myhost.com/files/Example • jar:/lib/classes.jar!/META-INF/manifest.n • tar:gz:http://anyhost/dir/mytar.tar.gz!/mytar/README.txt • tgz:file://anyhost/dir/mytar.tgz!/somepat • gz:/my/gz/file.gz • http://myusername@somehost/index.htm • webdav://somehost:8080/dist • ftp://myusername:mypassword@somehost/somefile.tgz • sftp://myusername:mypassword@somehost/downloads/somefile.tgz • smb://somehost/home • tmp://dir/somefile.txt • res:path/in/classpath/image.png • ram:///any/path/to/file.txt • mime:file:///your/path/mail/anymail.mim

2.20. servicemix-wsn2005

Overview

The servicemix-wsn2005 is a standard JBI Service Engine which implements the WS-Notification specification from Oasis.

2.21. servicemix-xmpp

Overview

The ServiceMix XMPP component is used to communicate with XMPP (Jabber) servers through the JBI bus.

xmpp:receiver

Property Name	Туре	Description
createAccount	boolean	Specify here if you want to create an account for the user if the user is currently not existing on the XMPP server.
endpoint	java.lang.String	The name of the endpoint.
filter	org.jivesoftware.smack.filter.PacketFilter	Here you can define a <code>PacketFilter</code> to use for filtering XMPP packets.
host	java.lang.String	With that method you can specify the host name of the XMPP server as hostname or ip address.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
login	boolean	Here you can specify if the user should login to the server or not. Not logging in means that endpoint itself will be created but it will be inactive.
marshaler	org.apache.servicemix.xmpp.marshaler.XMPPMarshalerSupport	With this method you can specify a marshaler class which provides the logic for converting an xmpp message into a normalized message. This class has to implement the interface <code>XMPPMarshalerSupport</code> or another class which implements it. If you don't specify a marshaler, the <code>DefaultXMPPMarshaler</code> will be used.
password	java.lang.String	This method sets the password for connecting to the XMPP server.
port	int	This method will set the port number for the XMPP connection. If nothing is defined the default XMPP port number 5222 will be used.
proxyHost	java.lang.String	Here you can specify the hostname or ip address of a proxy to be used to connect to the XMPP server. If you don't define this no proxy is used.
proxyPass	java.lang.String	If your proxy needs authentication you can specify here the user password. Leave this undefined if your proxy does not need authentication.
proxyPort	java.lang.String	Here you can specify the port of the proxy server. If you do not define this the default port (3128) will be used.
proxyType	java.lang.String	Here you can specify the type of proxy you have. Possible values are: <code>NONE</code> , <code>HTTP</code> , <code>SOCKS4</code> , <code>SOCKS5</code>
proxyUser	java.lang.String	If your proxy needs authentication you can specify here the user name.

		Leave this undefined if your proxy does not need authentication.
resource	java.lang.String	Specify here the resource string to submit to the XMPP server. Usually you define the identifier of the XMPP client here.
room	java.lang.String	Specify here an optional room to join. If set, the user will join that room and listens to messages there.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
targetEndpoint	java.lang.String	the name of the endpoint to which requests are sent
targetInterface	javax.xml.namespace.QName	the QName of the interface to which requests are sent
targetOperation	javax.xml.namespace.QName	the QName of the operation to which requests are sent
targetService	javax.xml.namespace.QName	the QName of the service to which requests are sent
targetUri	java.lang.String	Set the target service/endpoint/interface using a URI.
user	java.lang.String	This method if used to specify the user name to use for connecting to the XMPP server. It is not required that this user already exists but if not then the server should allow registration of new users and this user should not already exist with another password.

xmpp:sender

Property Name	Туре	Description
createAccount	boolean	Specify here if you want to create an account for the user if the user is currently not existing on the XMPP server.
endpoint	java.lang.String	The name of the endpoint.
host	java.lang.String	With that method you can specify the host name of the XMPP server as hostname or ip address.
interfaceName	javax.xml.namespace.QName	The qualified name of the interface exposed by the endpoint.
login	boolean	Here you can specify if the user should login to the server or not. Not logging in means that endpoint itself will be created but it will be inactive.
marshaler	org.apache.servicemix.xmpp.marshaler.XMPPMarshalerSupport	With this method you can specify a marshaler class which provides the logic for converting an xmpp message into a normalized message. This class has to implement the interface <code>XMPPMarshalerSupport</code> or another class which implements it. If you don't specify a marshaler, the

		<code>DefaultXMPPMarshaler</code> will be used.
participant	java.lang.String	Specify here an optional participant to send messages to. You have to define a room or participant in order to have send function working.
password	java.lang.String	This method sets the password for connecting to the XMPP server.
port	int	This method will set the port number for the XMPP connection. If nothing is defined the default XMPP port number 5222 will be used.
proxyHost	java.lang.String	Here you can specify the hostname or ip address of a proxy to be used to connect to the XMPP server. If you don't define this no proxy is used.
proxyPass	java.lang.String	If your proxy needs authentication you can specify here the user password. Leave this undefined if your proxy does not need authentication.
proxyPort	java.lang.String	Here you can specify the port of the proxy server. If you do not define this the default port (3128) will be used.
proxyType	java.lang.String	Here you can specify the type of proxy you have. Possible values are: <code>NONE</code> , <code>HTTP</code> , <code>SOCKS4</code> , <code>SOCKS5</code>
proxyUser	java.lang.String	If your proxy needs authentication you can specify here the user name. Leave this undefined if your proxy does not need authentication.
resource	java.lang.String	Specify here the resource string to submit to the XMPP server. Usually you define the identifier of the XMPP client here.
room	java.lang.String	Specify here an optional room to join. If set, the user will join that room and listens to messages there.
service	javax.xml.namespace.QName	The qualified name of the service the endpoint exposes.
user	java.lang.String	This method if used to specify the user name to use for connecting to the XMPP server. It is not required that this user already exists but if not then the server should allow registration of new users and this user should not already exist with another password.
